5 APPLICANT'S SUMMARY AND CONCLUSION

5.1 Materials and methods

Adsorption and desorption of [^{14}C]TZNG were measured using a batch equilibrium procedure according to OECD 106. The guideline is fulfilled, no relevant deviations from the guideline occurred.

5.2 Results and discussion

The Ka_{oc}–values varied between 204.5 and 432.5 and the Kd_{oc}–values between 270.8 and 527.2.

There was good correlation between the concentrations adsorbed and in solution for the concentration range tested ($r > 0.99$) in all soils.

5.2.1	Adsorbed amount [%]	The percentage adsorption of test substance varied between 22.7 and 82.3% of the applied amount depending on soil type and concentration.	
5.2.2	Ka	0.63 - 4.71 mg/g	
5.2.3	Kd	0.83 - 5.75 mg/g	
5.2.4	Ka_{oc}	204.5 - 432.5 mg/g (mean: 275.4 mg/g)	x
5.2.5	Ka/Kd	0.76 - 0.88 (mean: 0.81)	

5.3 Conclusion

Based on the classification of McCALL ET AL. (1980), TZNG is classified as being moderately mobile in soil.

5.3.1 Reliability 1

5.3.2 Deficiencies No

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1 Materials and methods

The German BBA guideline for lysimeter studies is an internationally accepted guideline. No relevant deviations from the guideline occurred.

5.2 Results and discussion

Distribution of radioactivity

The major part of the applied radioactivity recovered was found in the soil (about 44% of applied). About 55% of the applied radioactivity could not be recovered and was attributed to losses by mineralisation.

Degradation and residues in soil and leachate

The parent compound and the metabolites MNG, TZNG and NTG were identified in the soil samples.

In the total leachates, about 1.2% of applied radioactivity was detected. The highest annual concentration was found for the 2nd year and was about 0.383 µg parent equivalent/L. TI-435 was not detected in any of the leachates. The metabolites MNG and NTG were identified at maximum concentrations of 0.066 µg/L and 0.031 µg/L, respectively, in the third year. Unknown metabolites amounted to less that 0.05 µg parent equivalent/L.

5.3 Conclusion

On the basis of these findings, TI-435 and its degradation products are not expected to occur in relevant amounts in groundwater. Degradation in soil continuous. No accumulation in plants is to be expected.

5.3.1 Reliability 1

5.3.2 Deficiencies None

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1 Materials and methods

The acute immobilisation toxicity of TI-435 Technical to invertebrates (*Daphnia magna* STRAUS) was determined in a static test according to OECD No. 202 (1984) and Directive 92/69/EEC C.2. The following nominal test concentrations were used: 0, 1.0, 3.2, 10, 32, 100 and 270 mg/L. No deviations to the test guidelines occurred.

Section A7.4.1.2/02 **Acute toxicity to invertebrates**
Annex Point IIA7.2 ***Daphnia magna***

5.2	**Results and discussion**	After 24 hours of exposure to TI-435 Technical, no immobility of daphnids was observed up to the highest test concentration. However, at the end of the test (48 hours), immobile daphnids were observed at test concentrations ≥ 10 mg/L.	
5.2.1	EC_0 (48 hours)	3.2 mg/L	
5.2.2	EC_{50} (48 hours)	40 mg/L (confidence interval: 31 – 51 mg/L)	X
5.2.3	EC_{100} (48 hours)	> 270 mg/L	
5.3	**Conclusion**	The validity criteria can be considered as fulfilled. Validity criteria are summarised in Table A7_4_1_2_02-6.	
5.3.1	Reliability	1	
5.3.2	Deficiencies	No

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1	**Materials and methods**	The toxicity of TI-435 towards the freshwater alga *Selenastrum capricornutum* was tested according to FIFRA Subdivision J Series 123-2 which is in compliance with EC Directive 92/69/EEC, C.3. A static test over 120 hours with nominal concentrations of 0, 3.8, 7.5, 15, 30, 60 and 120 mg a.s./L was performed.	
5.2	**Results and discussion**	The mean measured concentrations were 3.5, 7.3, 15, 30, 59, and 120 mg a.s./L. The water quality parameters (pH and temperature) were within the acceptable limits. The EC_{50}-value for cell density was calculated to be 75 mg a.s./L after 72 h. The values for biomass and growth are given below.	X
5.2.1	NOE_rC	15 mg a.s./L (72 h)	X
5.2.2	E_rC_{50}	> 120 mg a.s./L (72 h)	X
5.2.3	E_bC_{50}	70 mg a.s./L (72 h)	X
5.3	**Conclusion**	Validity criteria can be considered as fulfilled.

3.4.9	Monitoring of TS concentration	[redacted]
3.4.10	Controls	[redacted]
3.4.11	Statistics	Linear regression analysis of log_{10} converted values (only for reference substance)

4 RESULTS

4.1	**Preliminary test**	Not performed
4.2	**Results test substance**	
4.2.1	Concentrations of test substance	1.0, 10, 100, and 1000 mg/L
4.2.2	Concentration/ response curve	Not applicable since the highest concentration tested did not result in inhibition of microbial activity.
4.2.3	Effect data	The treatment with TI-435 Technical did not result in significant inhibition at any of the concentrations (no reduction of the respiration rate compared to the controls). Accordingly, the EC_{50} for TI-435 Technical is > 1000 mg/L.
4.3	**Results of controls**	The 4 controls (without test substance) showed a mean respiration rate of 63.1 mg/L.
4.4	**Test with reference substance**	Performed
4.4.1	Concentrations	5, 15 and 45 mg/L
4.4.2	Results	EC_{50}: 8 mg/L Regression coefficient: 0.995

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1	**Materials and methods**	TI-435 Technical was tested for its inhibition to microbial activity according to Directive 88/302/EEC, Part C (identical to OECD 209). Activated sludge was exposed to 1.0, 10, 100, and 1000 mg a.s./L and the respiration rate measured in comparison to control solutions and to the reference substance 3,5-dichlorophenol.
5.2	**Results and discussion**	In a 3-hour range-finding test, TI-435 Technical did not inhibit the respiration of activate sludge at concentrations up to and including 1000 mg/L.
5.2.1	EC_{50}	> 1000 mg/L (nominal)

Section A7.4.1.4 Inhibition to microbial activity (aquatic)
Annex Point IIA7.4

5.3	**Conclusion**	The control respiration rates used to obtain the mean lay within 15% of each other. The EC_{50} of the reference inhibitor, 3,5-dichlorophenol, lay between 5 and 30 mg/L, indicating that the sludge used in this study was neither unusually sensitive nor abnormally robust. Thus, the validity criteria can be considered as fulfilled.

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1	**Materials and methods**	The early life-stage toxicity of TI-435 Technical to fish (fathead minnow) was tested according to US EPA OPPTS draft guideline No. 850.1400 (1996), US EPA-FIFRA Subdivision E, Series 72-4 (1982) and ASTM Standard E1241-88 (1988). The guidelines are in compliance with OECD 210. Fathead minnows were exposed 28 days post-hatch to nominal concentrations of 0, 1.3, 2.5, 5.0, 10 and 20 mg a.s./L. Hatching, mortality and growth of the fish was observed.
5.2	**Results and discussion**	Exposure to TI-435 at the concentrations tested showed no statistically significant effects on hatching success, larval survival, total length, wet weight or dry weight as compared to the controls. Additionally, time to hatch did not appear to be influenced.
5.2.1	NOEC	20 mg a.s./L (nominal)
5.2.2	LOEC	> 20 mg a.s./L (nominal)
5.2.3	MATC	> 20 mg a.s./L (nominal)
5.3	**Conclusion**	The validity criteria can be considered as fulfilled (see Table A7_4_3_2-5).
5.3.1	Reliability	1
5.3.2	Deficiencies	No

Section A7.4.3.2

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1	**Materials and methods**	The toxicity of TI-435 Technical to *Daphnia magna* reproduction was tested according to OECD No. 211 (revised draft, April 1997). No deviations to the guideline occurred. *Daphnia magna* STRAUS (Clone 5) were exposed in a semi-static test to nominal concentrations of 0.041, 0.12, 0.37, 1.1, 3.3, 9.9 and 29.7 mg/L for 21 days.
5.2	**Results and discussion**	Significant mortality of parent test organisms occurred at test concentrations ≥ 1.1 mg/L. At test concentrations ≥ 0.37 mg/L the number of juveniles per parent was significantly reduced compared to the control. First appearance of juveniles was significantly delayed at the concentrations 9.9 and 29.7 mg/L.
5.2.1	NOEC (reproduction)	0.12 mg/L (nominal)
5.2.2	LOEC (reproduction)	0.37 mg/L (nominal)
5.2.3	EC50 (reproduction)	5.7 mg/L
5.2.4	NOEC (mortality of parental)	0.37 mg/L (nominal)
5.2.5	LOEC (mortality of parental)	1.1 mg/L (nominal)
5.2.6	EC_{50} (mortality of parental)	29.7 mg/L (nominal)
5.3	**Conclusion**	Mortality of female *Daphnia* did not exceed 20% at the end of the test. The mean number of living offspring produced per parent animal surviving at the end of the test was > 60 in the control groups. The validity criteria can be considered as fulfilled (see Table A7_4_3_4-4).

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1 Materials and methods

The effects of TI-435 technical on larvae of *Chironomus riparius* in a water-sediment system was tested according to the proposed BBA guideline "Effects of plant protection products on the development of sediment-dwelling larvae of *Chironomus riparius* in a water-sediment system." (1995). In a static test, first instars (L1) larvae were exposed to nominal concentrations of 0.1, 0.32, 0.56, 1.0, 1.8, 3.2 and 10 µg a.s./L for 28 days and emergence and development of midges was observed.

5.2 Results and discussion

Emergence was not reduced at the initial nominal test concentrations of 0.10, 0.32 and 0.56 µg a.s./L. At the initial test concentration of 1.0 µg a.s./L, the emergence of midges was significantly lower than in the control. No adult midges emerged in the higher concentrations of 1.8 to 10 µg/L.

There was no statistical difference in development rate between the test concentrations with emergence and the control.

These results demonstrate the higher sensitivity of the emergence rate in comparison to the development rate.

5.2.1	EC_{15}/NOEC (emergence rate)	0.00072 mg a.s./L
5.2.2	EC_5 (emergence rate)	0.00057 mg a.s./L
5.2.3	EC_{10} (emergence rate)	0.00065 mg a.s./L
5.2.4	EC_{50} (emergence rate)	0.00106 mg a.s./L

5.3 Conclusion

Guideline requirements were fulfilled since 90% of the inserted larvae matured to adults in the controls.

5.3.1 Reliability 1

5.3.2 Deficiencies No

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1	**Materials and methods**	The effects of TMG (tech.) on larvae of *Chironomus riparius* in a water-sediment system was tested according to the proposed BBA guideline "Effects of plant protection products on the development of sediment-dwelling larvae of *Chironomus riparius* in a water-sediment system." (1995). In a static test, first instars (L1) larvae were exposed to a single nominal concentration of 0.1 mg TMG/L for 28 days and emergence and development of midges was observed.
5.2	**Results and discussion**	For the number of emerged midges a minimal statistical difference between control and the test concentration of 0.1 mg TMG/L (U-test, p=0.05) was evaluated, but was not considered as relevant. For the development rate a statistical delay was not observed at 0.1 mg TMG/L (STUDENT t-test, p=0.05).
5.2.1	EC_{15}/NOEC (emergence rate and development rate)	≥ 0.1 mg TMG/L
5.3	**Conclusion**	Guideline requirements were fulfilled since 100% of the inserted larvae matured to adults in the controls.
5.3.1	Reliability	1
5.3.2	Deficiencies	No

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1	**Materials and methods**	Toxic effects of TI-435 on a freshwater ecosystem was tested in accordance with the relevant guidelines at the time the study was performed, i.e. SETAC guideline and OECD draft for freshwater outdoor studies. No deviations from the guidelines occurred.
5.2	**Results and discussion**	
5.2.1	EAC (Ecologically Acceptable Concentration)	10 µg/L TI-435 (corresponding to 20 µg/L TI-435 50 WG)
5.3	**Conclusion**	The quality and validity criteria mentioned in the OECD guidance documents (i.e. both of 1996 and 2000) were fulfilled. The used mesocosm ponds modelled a realistic freshwater ecosystem with sufficient representation from all different trophic levels. The study focussed on the toxicity to aquatic insects, because earlier studies indicated that this might be of concern. Clear concentration-effect relationships were obtained in case of toxic effects. Based on these relationships and univariate statistics NOEC's as well as an EAC based on recovery data were obtained. The study period was sufficient to demonstrate complete recovery of the affected populations. The concentrations of the test substance were analytically verified in the application solutions, in the water columns as well as in sediment samples.

4.4.2	Nitrate control	[redacted]

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1	**Materials and methods**	The effects of TI-435 50% WDG on respiration and nitrogen transformation of soil microflora under aerobic conditions was determined according to OECD 216 and 217. TI-435 50% WDG was incorporated into a sandy loam soil at treatment rates of 0.2 mg a.s./kg dw soil (equivalent to the maximum field application rate, i.e. 150 g a.s./ha) and 1.0 mg a.s./kg dw soil (equivalent to 5 x the maximum field application rate, i.e. 750 g a.s./ha).
5.2	**Results and discussion**	Short-term respiration and nitrogen transformation of soil treated with TI-435 50% WDG at up to 750 g a.s./ha deviated from the control by less than 25%.
5.3	**Conclusion**	Validity criteria can be considered as fulfilled (results of solvent controls and reference substance are in an acceptable range). Based on these results, TI-435 is no expected to adversely affect the soil microflora when applied up to 750 g a.s./ha (equivalent to 1.0 mg a.s./kg dry soil).
5.3.1	Reliability	1
5.3.2	Deficiencies	No

3.3.3	Test organisms	[redacted]
3.3.4	Test system	[redacted]

Section A7.5.1.2/01 Annex Point IIIA XIII.3.2 Acute toxicity to earthworms or other soil non-target macro-organisms

3.3.5	Test conditions	[redacted]
3.3.6	Test duration	[redacted]
3.3.7	Test parameter	[redacted]
3.3.8	Examination	[redacted]
3.3.9	Monitoring of test substance concentration	No
3.3.10	Statistics	The LC_{50} for the mortality was calculated by Probit analysis. The NOEC was determined for percentage weight change after 14 days and was analysed using one-way analysis of variance (ANOVA). Where this showed a significant treatment effect ($p<0.05$), pairwise comparison of each concentration versus control was made using Dunnett's test.

4 RESULTS

4.1	**Filter paper test**	Not performed
4.2	**Rangefinder test**	Performed
4.2.1	Concentration	0, 0.1, 1, 10, 100 and 1000 mg/kg dw artificial soil
4.2.2	Proposed LC_{50}	The rangefinder test indicated 7 and 14 day LC_{50} values between 10 and 100 mg/kg dw soil.
4.3	**Definite test**	
4.3.1	Initial concentrations of test substance	0, 10, 18, 32, 56 and 100 mg/kg dw artificial soil
4.3.2	Effect data (Mortality)	See Tables A7_5_1_2_01-4 and A7_5_1_2_01-5
4.3.3	Concentration / effect curve	See Figure A7_5_1_2_01-1
4.3.4	Other effects	The mean weight of the worms (per replicate) was between 376 mg and 507 mg on day 0. There was a significant reduction in mean body weight in TI-435 treatments of 24.5% at 10 mg/kg and of 22.4% at 18 mg/kg. Accordingly, the 14-day NOEC was <10 mg/kg. However, a loss of 7% in body weight was also seen in the control animals.
4.4	**Results of controls**	
4.4.1	Mortality	No mortalities occurred in the controls.
4.4.2	Number/ percentage of earthworms showing adverse effects	Earthworms of controls showed a 7% mean reduction in body weight at the end of the test (day 14).
4.4.3	Nature of adverse effects	See 4.4.2
4.5	**Test with reference substance**	Performed

Section A7.5.1.2/01 Annex Point IIIA XIII.3.2 — Acute toxicity to earthworms or other soil non-target macro-organisms

4.5.1	Concentrations	0, 10, 19, 34, 61 and 110 mg/kg dw artificial soil
4.5.2	Results	The 7 day and 14 day LC_{50} of 2-chloroacetamide to *Eisenia foetida* was calculated to be 30.83 and 26.55 mg/kg dw artificial soil, respectively, indicating an acceptable response of the test system.

5 APPLICANT'S SUMMARY AND CONCLUSION

5.1	**Materials and methods**	The acute toxicity of TI-435 technical to earthworms was tested according to OECD No. 207 (1984) and Directive 87/302/EEC, Part C. *Eisenia foetida* were exposed to nominal concentrations of 0, 10, 18, 32, 56 and 100 mg a.s./kg dw artificial soil and effects on mortality and body weight were observed.
5.2	**Results and discussion**	After 7 days, there was 100% mortality in 56 and 100 mg/kg treatments, with some mortality in all TI-435 treatments. After 14 days, there was 100% mortality in 32, 56 and 100 mg/kg treatments, with some mortality in all lower TI-435 treatment replicates. There were no control mortalities. Surviving earthworms in the 10 and 18 mg/kg treatments showed a significant reduction in mean body weight at the end of the test.
5.2.1	NOEC	< 10 mg/kg dw soil (based on reduction in body weight)
5.2.2	LC_{50} (7 days exposure)	18.58 mg/kg dw soil (calculated)
5.2.3	LC_{50} (14 days exposure)	13.21 mg/kg dw soil (calculated)
5.2.4	LC_{100} (14 days exposure)	32 mg/kg dw soil (nominal)
5.3	**Conclusion**	Validity criteria can be considered as fulfilled since no mortalities occurred in the controls and the toxic reference test showed an acceptable response of the test system (see also Table A7_5_1_2_01-6).
5.3.1	Reliability	1
5.3.2	Deficiencies	No
