

MOCA is for use only in a closed-system casting machine. Protective clothing should be worn when putting the product into the casting machine, in the form of an anti-chemical suit, a mask with A2P2 filters for facial protection, and E420 hand protection; the product is loaded into the machine at room temperature and once the loading door is closed the machine may be turned on.

The time taken to load the product should be as short as possible.

Use must be authorised by the undertaking.

When finished, the gloves are replaced and contaminated gloves are put in a recycling bin for subsequent removal by an external service provider.
