What is ECHA doing to prepare for the next wave of CSRs ?

ENES Workshop

24-25 November 2011, Brussels

Andreas Ahrens
ECHA – Computational Assessment Unit

Messages

- Meet deadline <u>and</u> think/plan long-term. ECHA and industry to develop a common understanding on the long-term process to make exposure scenarios concept work in practice.

- ECHA is developing approaches and tools to get a better grip on the information we receive with the CSRs in order
  - to be able to systematically feed back to industry
  - to make use of the contained information for the various processes

- Develop and maintain Chesar and IUCLID as tools supporting consistent, efficient and transparent CSAs and CSRs.

- Preparing for the next waive of CSRs includes support to downstream user processes

- Provide practical guidance and examples worked out in co-operation with industry

Roadmaps

Objective

- Arriving at CSRs that can serve as a source of good quality information
- Getting the communication and assessment processes in the supply chain in place and functioning

Developing Roadmaps

- Actors get orientation on the logical sequence of actions to do
- Actors get orientation on timing
- Cluster actions together to be more efficient

Processing CSR information at ECHA

Challenge

- text-files

- distribution and relationship of information between lead CSR and member CSR not transparent

Solutions under way

- Include in IUCLID 3.5 the possibility to indicate for each use whether it is covered in the joint CSR or in the member's CSR

- Mechanisms to extract information from the CSRs

Developing Chesar

- Chesar 2.0 as a (non mandatory) tool for efficient generation of CSR and exposure scenarios for communication
  - CSA Workflow support
  - (Re)-use of ES/CSA elements (including those prepared by sector organisations
  - Consistency between hazard assessment conclusions and exposure assessment
  - Consistency between CSR and exposure scenario for communication
  - Automated generation of CSR and ES for communication
- Closely co-operate with industry on compatibility of the different system elements (GES, SpERCs, EScomXML, Phrase catalogue), and by this support to standardisation
- Extensive training and support for Chesar users

http://echa.europa.eu

Practical guidance

- Identify needs in dialogue with industry
- (Potential) themes for current and future work related to practical guidance, manuals and examples
    - How to avoid the most frequently occurring misunderstandings in use reporting?
    - Concept, role and boundaries of scaling
    - Check by downstream users whether their process and products are supported by the exposure scenarios received
    - Exposure scenario information for substances in mixture

    - From hazard assessment conclusions to exposure assessment
    - Inclusion of risk management measures on physicochemical health hazards into the CSR
    - Exposure assessment and qualitative risk characterisation for hazards without DNEL

Thank you.
