

Decision number: CCH-D-2114308147-56-01/F Helsinki, 28 October 2015

DECISION ON A COMPLIANCE CHECK OF A REGISTRATION PURSUANT TO ARTICLE 41(3) OF REGULATION (EC) NO 1907/2006

41(5) OF REGULATION (EG) NO 1507/2000
For Fatty acids, C18-unsatd., dimers, oligomeric reaction products with tall-oil fatty acids and triethylenetetramine, EC No 500-191-5 (CAS No 68082-29-1), registration number:
Addressee:
The European Chemicals Agency (ECHA) has taken the following decision in accordance with the procedure set out in Articles 50 and 51 of Regulation (EC) No 1907/2006 concerning the Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH Regulation).
I. <u>Procedure</u>
Pursuant to Article 41(1) of the REACH Regulation ECHA has performed a compliance check of the registration for Fatty acids, C18-unsatd., dimers, oligomeric reaction products with tall-oil fatty acids and triethylenetetramine, EC No 500-191-5 (CAS No 68082-29-1), submitted by (Registrant). The scope of this compliance check decision is limited to the standard information requirements of Annex VI, Section 2 of the REACH Regulation
This decision is based on the registration as submitted with submission number, for the tonnage band of 1000 tonnes or more per year. This decision does not take into account any updates after the date when the draft decision was notified to the Registrant under Article 50(1) of the REACH Regulation.
This compliance check decision does not prevent ECHA from initiating further compliance

The compliance check was initiated on 12 March 2015.

checks on the present registration at a later stage.

On 05 May 2015 ECHA sent the draft decision to the Registrant and invited him to provide comments within 30 days of the receipt of the draft decision.

On 10 June 2015 ECHA received comments from the Registrant on the draft decision.

While considering the Registrant's comments submitted on 10 June 2015, ECHA Secretariat observed that no deadline to provide the requested information was given in Section II of the draft decision submitted to the Registrant on 05 May 2015. On 07 July 2015, ECHA sent an amended draft decision to the Registrant and invited him to provide comments on the deadline by 21 July 2015.

On 20 July 2015 ECHA received comments from the Registrant on the draft decision, which were identical to those comments submitted by the Registrant on the draft decision on 10 June 2015. There were no comments submitted concerning the deadline.

CONFIDENTIAL 2 (12)

The ECHA Secretariat considered the Registrant's comments.

The information is reflected in the Statement of Reasons (Section III) whereas no amendments to the Information Required (Section II) were made.

On 23 July 2015 ECHA notified the Competent Authorities of the Member States of its draft decision and invited them pursuant to Article 51(1) of the REACH Regulation to submit proposals for amendment of the draft decision within 30 days of the receipt of the notification.

As no proposal for amendment was submitted, ECHA took the decision pursuant to Article 51(3) of the REACH Regulation.

II. Information required

A. Information in the technical dossier related to the identity of the substance

Pursuant to Articles 41(1), 41(3), 10(a)(ii) and Annex VI, Section 2 of the REACH Regulation the Registrant shall submit the following information for the registered substance subject to the present decision:

- 1. Name or other identifier of the substance (Annex VI, 2.1.), as specified under section III.A.1 below;
- 2. Composition of the substance (Annex VI, 2.3.), as specified under section III.A.2 below;
- 3. Description of the analytical methods or bibliographical references (Annex VI, 2.3.7.), as specified under section III.A.3 below.

Taking into consideration the data currently available in the dossier, ECHA considers the following. Section III below specifies in detail all the information that ECHA considers appropriate in order to identify any substance of Unknown or Variable composition, Complex reaction products or Biological materials (UVCB). UVCB substances cannot be sufficiently identified by their chemical composition, because the number of constituents is relatively large; and/or the composition is, to a significant part, unknown; and/or the variability of composition is relatively large or poorly predictable. As a consequence, UVCB substances require other types of information for their identification, in addition to what is known about their chemical composition.

As a result, ECHA cannot be in a position, before receiving suitable information, to determine precisely the other types of information that is actually required to identify a specific UVCB substance. Only the Registrant of that UVCB substance knows the details of its identity. Based on this knowledge, he may consider that some of the information requested by ECHA is not suitable and necessary in order to identify the substance. Nevertheless, in that case it is the Registrant's exclusive responsibility 1) to ensure that ECHA is in a position to identify precisely the substance and 2) to justify the reasons for which some information requested may have been omitted.

Therefore, if the Registrant eventually decides to submit only part of the detailed information specified in Section III and if the submitted information does not enable ECHA to establish and verify the identity of the substance actually covered by the dossier, the registration will not be considered valid.

B. Deadline for submitting the required information

Pursuant to Articles 41(4) and 22(2) of the REACH Regulation the Registrant shall submit to ECHA by **04 February 2016** an update of the registration dossier containing the information required by this decision.

III. Statement of reasons

Pursuant to Article 41(3) of the REACH Regulation, ECHA may require the Registrant to submit any information needed to bring the registration into compliance with the relevant information requirements.

A. Information in the technical dossier related to the identity of the substance

Pursuant to Article 10(a)(ii) of the REACH Regulation, the technical dossier shall contain information on the identity of the substance as specified in Annex VI, Section 2 of the REACH Regulation. In accordance with Annex VI, Section 2 the information provided shall be sufficient to enable the identification of the registered substance.

1. Name or other identifier of the substance (Annex VI, Section 2.1)

ECHA notes that the Registrant identified the registered substance as of Unknown or Variable composition, Complex reaction products or Biological materials (UVCB). Information required to be provided according to Annex VI, Section 2.1. of the REACH Regulation on the naming of UVCB substances such as the registered substance shall consist of two parts: (1) the chemical name and (2) a more detailed description of the manufacturing process, as indicated in section 4.3 of the Guidance for identification and naming of substances under REACH and CLP (Version: 1.3, February 2014) – referred to as "the Guidance" hereinafter. According to the Guidance, the description of the manufacturing process shall include information on the chemical identity of the starting materials (see point (i), below) and information on the most relevant steps of the process (see point (ii), below). Any other identifier, including any CAS number (if available) and any EC number (if available and appropriate) for the substance shall also be reported.

(i). Identity of the starting materials

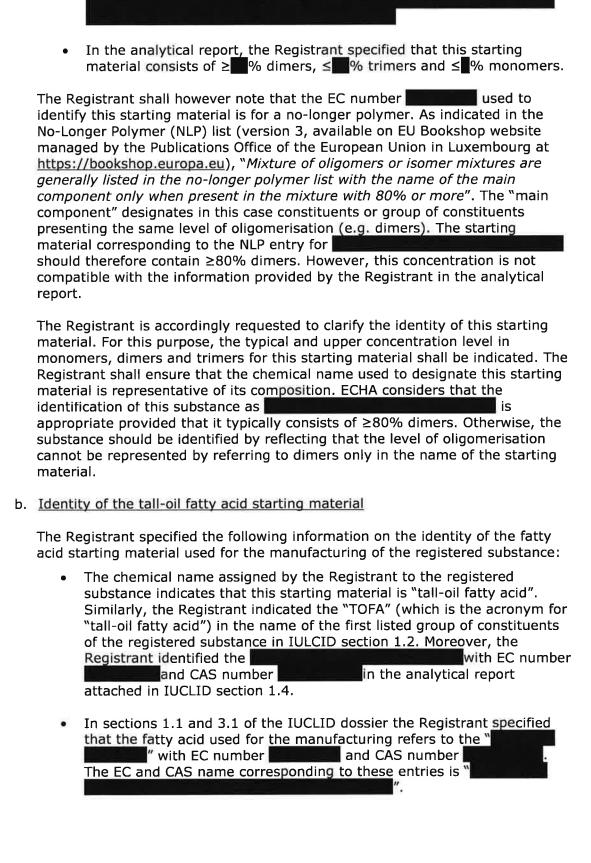

According to the chemical name assigned by the Registrant to the registered substance, this registration refers to a UVCB substance obtained from the following starting materials: a fatty acid dimer; a tall-oil fatty acid; and a polyamine.

a. Identity of the fatty acid dimer starting material

The Registrant specified the following information on the identity of the fatty acid dimer starting material used for the manufacturing of the registered substance:

• The chemical name assigned by the Registrant to the registered substance indicates that this starting material is "Fatty acids, C18-unsatd., dimers". Similarly, in sections 1.1 and 3.1 of the IUCLID dossier as well as in the analytical report attached in IUCLID section 1.4, the Registrant specified that the fatty acid dimer starting material used corresponds to a

c.

These statements are contradicting as they refer to different starting materials. The Registrant should note in particular that, unlike " ", " is for instance not characterised by the presence of constituents such as Therefore, the Registrant is requested to clarify the identity of the fatty acid starting material(s) used for the manufacturing of the registered substance by specifying consistently if this starting material is " " or if it is " ". Identity of the polyamine starting material			
The following information related to the identity of the polyamine starting material used for the manufacturing of the registered substance has been submitted by the Registrant:			
• The chemical name assigned by the Registrant to the registered substance indicates that this starting material refers to "triethylenetetramine". The name for such polyamines however does not specify the relative position of the 3 ethylene groups and the 4 amino functionalities. This name alone is therefore not sufficient to understand if this starting material has a linear structure, a branched structure or a combination thereof. ECHA acknowledges that this chemical name has been used for the international chemical identification of the linear structure, i.e. the mono-constituent substance "trientine" with EC number 203-950-6 and CAS number 112-24-3, as for instance illustrated by the Annex VI inventory entry of the Regulation (EC) No 1272/2008 on the classification, labelling and packaging of substances and mixtures (CLP Regulation). However, ECHA notes that, in sections 1.1 and 3.1 of the IUCLID dossier, the Registrant specified that the "triethylenetetramine" used for the manufacturing correspond to the substance with EC number and CAS number			
In the analytical report attached in IUCLID section 1.4, the Registrant identified the polyethylenepolyamine starting material using the EC number and the CAS number. The EC name and CAS name for these entries is "". However, ECHA stresses that these identifiers do not specifically describe the mono-constituent substance trientine.			
ECHA also notes that, in the same analytical report attached in IUCLID section 1.4, the Registrant reported the compositional profile of the starting material. According to this information, its composition can cover both			

•		nposition of the registered substance specified in IUCLID dossier, the Registrant reported the presence
	of	that he described as
		have been identified using the EC
	number	and the CAS number
	****	and assigned the
	chemical name	and
	the description	
		to this group of constituents.

Based on the above, ECHA concludes that the information submitted by the Registrant regarding the identity of the polyamine starting material used for the manufacturing refers to different substances:

The Registrant is accordingly requested to clarify the identity of the polyethylenepolyamine starting material used for the manufacturing of the registered substance by specifying consistently its identity throughout the dossier.

(ii). Description of the manufacturing steps

According to the description provided by the Registrant in section 1.1 of the Registration dossier, the process used for the manufacturing of the registered substance is a During the reaction,

Section 3.1 of the IUCLID dossier also specifies process parameters used for the manufacturing. In particular, it is indicated that the . The Registrant also indicated that "

ECHA however considers that the description of the manufacturing steps reported in the dossier is not sufficiently detailed for the following reasons:

- The relative ratio of each reactant (i.e. the tall-oil fatty acid, the fatty acid dimers and the polyethylenepolyamine) has not been specified.
- The Registrant did not indicate if the process parameter used for the manufacturing of the substance (in this case the temperature) effectively promotes the formation of constituents.
- The Registrant did not describe the steps applied to isolate the substance, including any eventual purification steps undertaken.

CONFIDENTIAL 7 (12)

The Registrant is accordingly required to provide details of the manufacturing processing steps that are applied to the starting materials. The information submitted by the Registrant must at least include the following:

- The molar ratio between the different starting materials used.
- A description of the manufacturing steps in the order they occur, including any preliminary step, the steps involving chemical transformation as well as the isolation and purification steps carried out for the synthesis.
- For each step, all relevant process parameters that affect the composition and therefore the identity of the substance must be provided. For the step involving chemical transformations, the Registrant must indicate if the selected process parameter (in this case the temperature) promotes the formation of

(iii). The CAS number

The Registrant assigned the CAS number 68082-29-1 to the registered substance. The CAS name for this entry is "Fatty acids, C18-unsatd., dimers, polymers with tall-oil fatty acids and triethylenetetramine". This CAS number 68082-29-1 is linked in the No-Longer Polymer (NLP) list (version 3, available on EU Bookshop website managed by the Publications Office of the European Union in Luxembourg at https://bookshop.europa.eu) to the EC entry 500-191-5 also assigned by the Registrant to the registered substance.

The Registrant shall note, however, that as explained in the NLP list (page 8 of the document) "NLP-Nos and name descriptions take precedence. The CAS-RN given are to be treated as indicative and for a use as a searching tool". ECHA considers that the CAS information included in the registration dossier is generic and therefore does not sufficiently describe the registered substance. Indeed the CAS name includes a reference to "polymer" whilst the NLP list is an inventory of substances which do not meet the definition of polymer within the meaning of Article 3(5) of the REACH Regulation.

The Registrant is accordingly requested to delete the CAS entry from the CAS information for the registered substance and provide instead any CAS number specifically corresponding to the registered substance (if available). If the Registrant deems it appropriate, he can however specify the current CAS entry as "related CAS information" for the registered substance.

ECHA recognises that the Registrant may cover different grades of the same substance in a registration based on different sources and/or different manufacturing processes. In these cases, the Registrant shall provide the required information on the source, manufacturing process and constituents of each grade. ECHA underlines that the reporting of one single generic process description to cover the manufacturing of several different grades may prevent ECHA from concluding that the manufacturing of other substances is not covered by that description. In addition, ECHA highlights that grades for which a description would not be provided may eventually not be considered as being covered by the registration.

The Registrant shall also note that the description of different manufacturing processes may indicate that multiple substances are actually manufactured and consequently that multiple

registrations are required. In addition, for substances such as the registered substance (UVCB sub-type 2 according to chapter 4.3.1.2.4 of the Guidance), the identification is based on the starting materials for the reaction and the reaction process. Accordingly, the use of different starting materials (e.g. the use of different polyamines, different fatty acid dimers or different fatty acids) would normally be expected to lead to the manufacturing of different substances. ECHA has set up a process enabling registrants to adapt their registration in such cases. Should the Registrant consider that his dossier actually concerns several substances, he is thus encouraged to contact ECHA for a possible adaptation of the registration.

As for the reporting of the information in IUCLID, the chemical name and the manufacturing process description for the registered substance shall be reported in the "IUPAC name" field and the "Description" field of the reference substance in IUCLID section 1.1, respectively. Any CAS number specifically corresponding to the registered substance shall be reported under the "CAS information" header of the reference substance in IUCLID section 1.1. The Registrant shall ensure that the chemical name and other identifiers reported in section 1.1 of the IUCLID dossier are representative of the UVCB substance as described by the manufacturing process. In particular, the naming of the starting materials used in the process and to be quoted in the name of the registered substance shall also follow the naming conventions specified in the Guidance. The Registrant shall note that the registration is currently linked to chemical identifiers (including the EC number 500-191-5) referring to reaction products of fatty acids, C18-unsatd., dimers, polymers with tall-oil fatty acid and triethylenetetramine. Should the substance intended to be covered by this registration refer to a different substance, the Registrant can however not remove or modify at this stage identifiers such as the EC number for technical reasons, the registration being linked to that number in REACH-IT. To ensure unambiguous identification of the registered substance, the Registrant shall however indicate, in the "Remarks" field of the reference substance in IUCLID section 1.1, the following: "The EC number 500-191-5 currently assigned does not specifically correspond to the registered substance. This identifier cannot be modified or deleted at this stage in the present registration update for technical reasons". The Registrant shall also specify, in the same "Remarks" field, any available and appropriate EC number for the substance. Registrant shall note that ECHA has established a process, subject to certain conditions, enabling registrants to adapt an existing registration, while maintaining the regulatory rights already conferred to the substance concerned.

The Registrant shall ensure that the correct identifiers are used throughout the registration whenever reference to the specific substance which is the subject of this registration is made.

In the comments to the draft decision, the Registrant agreed to clarify the identity of the starting materials, to provide more details of the manufacturing steps and to delete the CAS entry from the CAS information for the registered substance. Also, the Registrant agreed to specify the current CAS entry as "related CAS information" for the registered substance. The information to be provided by the Registrant will only be assessed on the basis of an updated dossier.

2. Composition of the substance (Annex VI, Section 2.3.)

The substance composition corresponds to the chemical representation of what the substance consists of and is therefore an essential part of substance identification and the cornerstone of all the REACH obligations.

CONFIDENTIAL 9 (12)

Annex VI, section 2.3. of the REACH Regulation requires that each registration dossier contains sufficient information for establishing the composition of the registered substance and therefore its identity.

In that respect, according to chapter 4.3 of the Guidance, the Registrant shall note that for UVCB substances (substances of Unknown, or Variable Composition, or of Biological origin) presenting a large number of constituents, such as the registered substance, the following applies:

- All constituents present in the substance with a concentration of ≥ 10 % shall be identified and reported individually,
- All known constituents and constituents relevant for the classification and/or PBT assessment of the registered substance shall be identified and reported individually; and
- Unknown constituents shall be identified as far as possible by a generic description of their chemical nature.

For each constituent or group of constituent, the typical, minimum and maximum concentrations shall be specified.

ECHA notes that the Registrant reported the presence of 2 groups of constituents in the composition of the registered substance:

% of the
composition;
• Market and the second of the
composition;
The constituents resulting from the chemical transformations are thus essentially reported under one main generic group (the first listed group of constituents). The Registrant has no provided any structural information on the constituents actually obtained from the chemical reactions. There is also no reference to the possible presence of the mentioned in the manufacturing process description. ECHA underlines that, as
already mentioned in section III.A.1. (ii) hereinabove, the Registrant explained that the manufacturing process conditions determine the extent to which the transformations will
lead to the formation of The concentration levels constituents would thus be expected to be controlled and therefore known.

In addition, the reported composition does not provide any information on the relative contribution of the 'fatty acid dimers' and the 'fatty acids' building blocks in the composition of the substance.

ECHA therefore considers that the composition currently provided does not allow ECHA to identify sufficiently precisely the composition of the substance

The Registrant is accordingly requested to specify the identity and typical, upper and lower concentration level of the constituents and groups of constituents required to be reported. Concerning the reporting of the unknown constituents, the Registrant shall note that, for substances such as the registered substance, a subdivision of these unknown constituents

according to the number of 'fatty acid dimers', 'fatty acids' and 'polyethylenepolyamine' building blocks is necessary for this purpose as a baseline. The relative content in

should also be

specified.

ECHA notes that in the event the Registrant covers different grades of the registered substance in the present registration dossier, he shall report separately the compositional information of each grade. This means that if the substance covered by the present registration has two (or more) different compositions, then these must be presented separately. ECHA highlights that failure to report separately the compositional information of each grade of a substance may result in one or more grades not being covered by this registration.

Regarding how to report the composition in IUCLID, the following applies: the Registrant shall indicate each composition of the registered substance in IUCLID section 1.2. For each constituent required to be reported individually, the IUPAC name, CAS name and CAS number (if available), molecular and structural formula, as well as the minimum, maximum and typical concentration, shall be reported in the appropriate fields in IUCLID. For the other constituents to be reported under a generic description, a generic chemical name describing the group of constituents, generic molecular and structural information (if applicable), as well as the minimum, maximum and typical concentration, shall be reported in the appropriate fields in IUCLID.

Further technical details on how to report the composition of UVCB substances in IUCLID are available in paragraphs 2.1 and 2.2.2 of the Data Submission Manual – Part 18: How to report the substance identity in IUCLID 5 for registration under REACH (version: 2.0, July 2012) on the ECHA website. Information on how to report several compositions in IUCLID is specified in paragraph 2.3, Q&A8 of that manual.

The Registrant shall ensure that the reported composition is consistent with the description of the process used for the manufacturing of the registered substance, including the identity of the starting materials used. The Registrant shall also ensure that the composition is verifiable and therefore supported by a description of the analytical methods for the quantification of the constituents required to be reported, as required under Annex VI, section 2.3.7.

In the comments to the draft decision, the Registrant agreed to clarify the substance composition and to provide to ECHA structural representation of the substance's constituents. The Registrant also explained that, due to the nature and complexity of the reaction mixture, the quantification will be based on estimation of the analytical results (HPLC and GPC) since separation of the different adducts is not possible with available techniques as confirmed by LC-MS. The Registrant also indicated his intention to describe the constituents according to their molecular weight distribution providing semi-quantitative information.

Irrespective of whether the newly provided information may be sufficient to meet the information requirement addressed in the decision, ECHA can already point out the following: the information in the comments would seem to be in line with the expectations in the draft decision. The Registrant shall ensure that any eventual analytical limitations in

establishing the composition of the registered substance is reported transparently in the updated registration dossier. The scientific rationale behind such limitations shall be attached in section 1.4 of the IUCLID dossier. The information to be provided by the Registrant will only be assessed on the basis of an updated dossier.

3. Description of the analytical methods (Annex VI, Section 2.3.7.)

ECHA observes that the Registrant did not provide sufficient and appropriate description of the analytical methods used for the identification and quantification of the constituents and groups of constituents required to be reported in the composition of the registered substance, as requested according to Annex VI section 2.3.7.

ECHA therefore concludes that the Registrant did not provide sufficient description of the analytical methods used for the identification and quantification of the constituents and groups of constituents required to be reported in the composition of the registered substance.

The Registrant is accordingly requested to provide a description of the analytical methods used for the identification and quantification of the constituents and groups of constituents required to be reported in the composition of the registered substance. The description shall be sufficient for the methods to be reproduced and shall therefore include details of the experimental protocol followed, any calculation made and the results obtained. The Registrant should note that ECHA will consider any method that is suitable to verify the composition, including any indirect method involving chemical derivatisation of the substance or any analysis involving also considerations on the starting materials and the manufacturing process.

As for the reporting of the data in the registration dossier, the information shall be attached in IUCLID section 1.4.

The Registrant shall ensure that the composition reported in the dossier is consistent with the analytical results obtained.

In the comments to the draft decision, the Registrant agreed to review IUCLID section 1.2 concerning the composition and to align it with the analytical data in IUCLID section 1.4. Also, the method and the interpretation part will be expanded to include typical structures, calculations and results to help the reviewer determine how such results have been obtained. As for the description of the reactants, this has been provided in the first part of the analytical report. The information to be provided by the Registrant will only be assessed on the basis of an updated dossier.

CONFIDENTIAL 12 (12)

IV. Information on right to appeal

An appeal may be brought against this decision to the Board of Appeal of ECHA under Article 51(8) of the REACH Regulation. Such an appeal shall be lodged within three months of receiving notification of this decision. Further information on the appeal procedure can be found on ECHA's internet page at http://www.echa.europa.eu/regulations/appeals. The notice of appeal will be deemed to be filed only when the appeal fee has been paid.
