LIST OF ABBREVIATIONS

CMR  Carcinogenic, Mutagenic or toxic to Reproduction
EGEE  2-Ethoxyethanol
EGME  2-Methoxyethanol
EU RAR  European Union Risk Assessment Report
PBT  Persistent, Bioaccumulative and Toxic
SVHC  Substance of Very High Concern
vPvB  Very Persistent and very Bioaccumulative
Substance Name(s): 2-Ethoxyethanol (ethylene glycol monoethyl ether; EGEE)

EC Number(s): 203-804-1

CAS number(s): 110-80-5

- 2-Ethoxyethanol is identified as a substance meeting the criteria of Article 57 (c) of Regulation (EC) 1907/2006 (REACH) owing to its classification as toxic for reproduction 1B.

Summary of how the substance meets the CMR (Cat 1 or 2), PBT or vPvB criteria, or is considered to be a substance giving rise to an equivalent level of concern

2-Ethoxyethanol (EGEE) is listed under index number 603-012-00-X in Annex VI, part 3, Table 3.2 (the list of harmonised classification and labelling of hazardous substances from Annex I to Directive 67/548/EEC) of Regulation (EC) No 1272/2008 as toxic to reproduction, category 2.

Therefore, this classification of the substance(s) in Regulation (EC) No 1272/2008 shows that the substance meets the criteria for classification as toxic for reproduction in accordance with Article 57 (c) of REACH.

Registration number(s) of the substance or of substances containing a given constituent/impurity or leading to the same transformation or degradation products:

Not relevant.

---

1 This corresponds to a classification as toxic for reproduction (1B) in Annex VI, part 3, Table 3.1 of Regulation (EC) No. 1272/2008 (list of harmonised classification and labelling of hazardous substances)

— Minimum classification for a category is indicated by the reference * in the column ‘Classification’ in Table 3.1.

For certain hazard classes, including acute toxicity and STOT repeated exposure; the classification according to the criteria in Directive 67/548/EEC does not correspond directly to the classification in a hazard class and category under this Regulation. In these cases the classification in this Annex shall be considered as a minimum classification. This classification shall be applied if none of the following conditions are fulfilled:

— the manufacturer or importer has access to data or other information as specified in Part 1 of Annex I that lead to classification in a more severe category compared to the minimum classification. Classification in the more severe category must then be applied;

— the minimum classification can be further refined based on the translation table in Annex VII when the physical state of the substance used in the acute inhalation toxicity test is known to the manufacturer or importer. The classification as obtained from Annex VII shall then substitute the minimum classification indicated in this Annex if it differs from it.

6 CONCLUSIONS ON THE SVHC PROPERTIES

6.1 CMR assessment

2-Ethoxyethanol (EGEE) is listed as entry 603-012-00-X in Annex VI, part 3, Table 3.2 (the list of harmonised classification and labelling of hazardous substances from Annex I to Directive 67/548/EEC) of Regulation (EC) No 1272/2008 as toxic to reproduction, category 2. This corresponds to a classification as toxic for reproduction (1B) in Annex VI, part 3, Table 3.1 of Regulation (EC) No. 1272/2008 (list of harmonised classification and labelling of hazardous substances).

Therefore, this classification of the substance(s) in Regulation (EC) No 1272/2008 shows that the substance meets the criteria for classification as toxic for reproduction in accordance with Article 57 (c) of REACH.
7 REFERENCES

Notice:
No re-evaluation was conducted of those references which are cited in this support document and which were taken from the Risk Assessment Report for 2-ethoxyethanol (EU RAR draft, 2008). For the present support document no comprehensive literature survey was carried out, but focus was given to exposure related data.

2-Ethoxyethanol was prioritised under the Existing Substance Regulation (ESR) (Regulation (EEC) No793/93), however, the risk evaluation and/or risk management work for this substance was not finalised by 1 June 2008 (i.e. the date the ESR regulation was repealed and replaced by the REACH Regulation). As rapporteur of this substance according to the ESR, Germany was required to develop an Annex XV transitional report for this substance. This report contains information on hazard and risk documented in an annexed risk assessment report (RAR) following the structure used under the ESR. It also provides information on what possible actions the submitting Member State considers to be necessary in order to reduce the risks identified in the RAR. The Annex XV transitional report has been submitted to ECHA according to the REACH Regulation (EC) No 1907/2006, Article 136(3).

Summary and discussion of reproductive toxicity according to EU RAR draft, 2008

Animal data

Several studies in mice and rats demonstrate adverse effects of 2-ethoxyethanol on the male reproductive system via different exposure routes. The effects reported include: reduction of testes weight and testicular atrophy, degeneration of testes, testicular edema, reduction of sperm count and motility, abnormal sperm morphology and spermatocyte degeneration and absence of more mature sperm cells. It is documented that EGEE adversely affected reproductive performance in mice of both sexes for at least one generation. A NOAEL fertility was derived from the study in CD1 mice of Lamb et al. (1984) of 800 mg/kg bw/day whereas it is stated in the EU RAR draft, 2008 that various other studies show spermatoxicity at clearly lower doses.

Male reproductive organ toxicity/spermatoxicity effects were reported in various repeated dose toxicity studies with different species.

It was also clearly shown that 2-ethoxyethanol adversely affects embryonic and fetal development in dose dependent manner. Increasing embryo-/fetomortality, fetal growth retardation and visceral/skeletal malformations and variations were reported at concentrations devoid of maternal toxicity. Table 31 summarises the effects of 2-ethoxyethanol on the reproductive system.

Conclusion:

Based on available animal data 2-ethoxyethanol is confirmed as reproductive toxicant and classified and labelled for its effects on fertility and development as Repr. Cat. 2; R 60/R61; and Repr. Cat 1b according to the CLP-Regulation respectively.

Human Data

The possible associations between exposure to glycol ethers and reproductive disorders were first investigated in a case control study (1019 cases, 475 controls) by Veulemans 1993. Exposure to EGEE was assessed by the presence of the urinary metabolites. Ethoxy acetic acid (EAA). EAA was detected in 39 patients and six controls, with a highly significant odds ratio of 3.11 (p=0.004). A high association of the occupational high exposure group with complete azoospermia and severe oligozoospermia was found. The association between urinary EAA and diagnosis remained significant taking into account possible confounders (other industrial spermatotoxic chemicals).

Further studies supported these findings. Table 32 summarises the findings of epidemiological studies on workers exposed to 2-ethoxyethanol.

</tbody>
</table>

OR: Odds ratio; CI: Confidence Interval

**Conclusion:**

Findings from several epidemiological studies indicate an association between occupational exposure to 2-ethoxyethanol (mostly monitored as EAA in urine) and impairment of reproduction in men and women. Whereas in men spermatotoxic effects (azoospermia, oligospermia) were reported, a higher risk in spontaneous abortions was reported in women.
Congenital malformations in humans such as neural tube defects, cleft lip and multiple anomalies were also associated with glycol ether exposure.

According to the EU RAR draft, 2008 the plausibility of the observations from epidemiology is supported by the data of numerous experimental studies, which demonstrated similar effects in laboratory animals.
