

Helsinki, 08 June 2022

**Addressees**

Registrants of JS\_Oleoamide as listed in the last Appendix of this decision

**Date of submission of the dossier subject to this decision**

11/02/2013

**Registered substance subject to this decision ("the Substance")**

Substance name: Amides, C18 (unsaturated)

List number: 931-801-1

**Decision number:** Please refer to the REACH-IT message which delivered this communication (in format CCH-D-XXXXXXXXXX-XX-XX/F)**DECISION ON A COMPLIANCE CHECK**

Under Article 41 of Regulation (EC) No 1907/2006 (REACH), you must submit the information listed in C.1. below by **13 September 2023**, and all other information listed below by the deadline of **17 March 2025**.

Requested information must be generated using the Substance unless otherwise specified.

**A. Information required from all the Registrants subject to Annex VII of REACH**

1. Skin sensitisation (Annex VII, Section 8.3.):
  - i. *in vitro/in chemico* skin sensitisation information on molecular interactions with skin proteins (OECD TG 442C), inflammatory response in keratinocytes (OECD TG 442D) and activation of dendritic cells (EU B.71/OECD TG 442E)(Annex VII, Section 8.3.1.); and
  - ii. Only if the *in vitro/in chemico* test methods specified under point 1.i. are not applicable for the Substance or the results obtained are not adequate for classification and risk assessment, *in vivo* skin sensitisation (Annex VII, Section 8.3.2.; test method: EU B.42./OECD TG 429)
2. In vitro gene mutation study in bacteria (Annex VII, Section 8.4.1.; test method: EU B.13/14. / OECD TG 471)
3. Long-term toxicity testing on aquatic invertebrates also requested below (triggered by Annex VII, Section 9.1.1., column 2)
4. Growth inhibition study aquatic plants (Annex VII, Section 9.1.2.; test method: EU C.3./OECD TG 201)
5. Ready biodegradability (Annex VII, Section 9.2.1.1.; test method: OECD TG 301B/C/D/F or OECD TG 310)

**B. Information required from all the Registrants subject to Annex VIII of REACH**

1. In vitro cytogenicity study in mammalian cells (Annex VIII, Section 8.4.2.; test method: OECD TG 473) or In vitro micronucleus study (Annex VIII, Section 8.4.2.; test method: OECD TG 487)

2. If negative results are obtained in tests performed for the information requirement of Annex VII, Section 8.4.1. and Annex VIII, Section 8.4.2. then: in vitro gene mutation study in mammalian cells (Annex VIII, Section 8.4.3.; test method: OECD TG 476 or TG 490)
3. Justification for an adaptation of a Short-term repeated dose toxicity (28 days) based on the results of the Sub-chronic toxicity study (90 days) requested below (Annex VIII, Section 8.6.1.)
4. Long-term toxicity testing on fish also requested below (triggered by Annex VIII, Section 9.1.3., column 2)

**C. Information required from all the Registrants subject to Annex IX of REACH**

1. Sub-chronic toxicity study (90-day) (Annex IX, Section 8.6.2.; test method: OECD TG 408) by oral route, in rats
2. Pre-natal developmental toxicity study (Annex IX, Section 8.7.2.; test method: OECD TG 414) by oral route, in one species (rat or rabbit)
3. Long-term toxicity testing on aquatic invertebrates (Annex IX, Section 9.1.5.; test method: EU C.20./OECD TG 211)
4. Long-term toxicity testing on fish (Annex IX, Section 9.1.6.; test method: OECD TG 210)
5. Long-term toxicity testing on terrestrial invertebrates also requested below (triggered by Annex IX, Section 9.4.1., column 2)
6. Effects on soil micro-organisms (Annex IX, Section 9.4.2.; test method: EU C.21./OECD TG 216)
7. Long-term toxicity to terrestrial plants also requested below (triggered by Annex IX, Section 9.4.3., column 2)

**D. Information required from all the Registrants subject to Annex X of REACH**

1. Pre-natal developmental toxicity study (Annex X, Section 8.7.2.; test method: OECD TG 414) by oral route, in a second species (rat/rabbit)
2. Long-term toxicity testing on terrestrial invertebrates (Annex X, Section 9.4.4.; test method: EU C.33/OECD TG 222 or EU C.32/OECD TG 220)
3. Long-term toxicity to terrestrial plants (Annex X, Section 9.4.6.; test method: EU C.31/OECD TG 208 with at least six species tested or ISO 22030)
4. Long-term toxicity testing to sediment organisms (Annex X, Section 9.5.1.; test method: EU C.35/OECD TG 225 or EU C.40/OECD TG 233 using spiked sediment)

Reasons for the request(s) are explained in the following appendices:

- Appendix entitled "Reasons common to several requests";
- Appendices entitled "Reasons to request information required under Annexes VII to X of REACH", respectively.

### **Information required depends on your tonnage band**

You must provide the information listed above for all REACH Annexes applicable to you, and in accordance with Articles 10(a) and 12(1) of REACH:

- the information specified in Annex VII to REACH, for registration at 1-10 tonnes per year (tpa), or as a transported isolated intermediate in quantity above 1000 tpa;
- the information specified in Annexes VII and VIII to REACH, for registration at 10-100 tpa;
- the information specified in Annexes VII, VIII and IX to REACH, for registration at 100-1000 tpa;
- the information specified in Annexes VII to X to REACH, for registration at more than 1000 tpa.

You are only required to share the costs of information that you must submit to fulfil your information requirements.

For certain endpoints, ECHA requests the same study from registrants at different tonnages. In such cases, only the reasoning why the information is required at lower tonnages is provided in the corresponding Appendices. For the tonnage where the study is a standard information requirement, the full reasoning for the request including study design is given. Only one study is to be conducted; the registrants concerned must make every effort to reach an agreement as to who is to carry out the study on behalf of the other registrants under Article 53 of REACH.

### **How to comply with your information requirements**

To comply with your information requirements, you must submit the information requested by this decision in an updated registration dossier by the deadline indicated above. You must also update the chemical safety report, where relevant, including any changes to classification and labelling, based on the newly generated information.

You must follow the general testing and reporting requirements provided under the Appendix entitled "Requirements to fulfil when conducting and reporting new tests for REACH purposes". In addition, you should follow the general recommendations provided under the Appendix entitled "General recommendations when conducting and reporting new tests for REACH purposes". For references used in this decision, please consult the Appendix entitled "List of references".

### **Appeal**

This decision, when adopted under Article 51 of REACH, may be appealed to the Board of Appeal of ECHA within three months of its notification to you. Please refer to <http://echa.europa.eu/regulations/appeals> for further information.

### **Failure to comply**

If you do not comply with the information required by this decision by the deadline indicated above, ECHA will notify the enforcement authorities of your Member State.

Authorised<sup>1</sup> under the authority of Mike Rasenberg, Director of Hazard Assessment

---

<sup>1</sup> As this is an electronic document, it is not physically signed. This communication has been approved according to ECHA's internal decision-approval process.

## Appendix on Reasons common to several requests

### 1. Assessment of your read-across approach under Annex XI, Section 1.5.

You seek to adapt the following standard information requirements by applying (a) read-across approach(es) in accordance with Annex XI, Section 1.5:

- Skin sensitisation (Annex VII, Section 8.3.)
- In vitro gene mutation study in bacteria (Annex VII, Section 8.4.1.)
- In vitro cytogenicity study in mammalian cells or in vitro micronucleus study (Annex VIII, Section 8.4.2.)
- In vitro gene mutation study in mammalian cells (Annex VIII, Section 8.4.3.)
- Short-term repeated dose toxicity (28 day), (Annex VIII, Section 8.6.1.)
- Sub-chronic toxicity study (90-day), (Annex IX, Section 8.6.2.)
- Pre-natal developmental toxicity study (Annex IX, Section 8.7.2.)
- Ready biodegradability (Annex VII, Section 9.2.1.1.)
- Long-term toxicity testing on aquatic invertebrates (Annex IX, Section 9.1.5.)
- Long-term toxicity testing on fish (Annex IX, Section 9.1.6.1.)

ECHA has considered the scientific and regulatory validity of your read-across approach(es) in general before assessing the specific standard information requirements in the following appendices.

Annex XI, Section 1.5. specifies two conditions which must be fulfilled whenever a read-across approach is used. Firstly, there needs to be structural similarity between substances which results in a likelihood that the substances have similar physicochemical, toxicological and ecotoxicological properties so that the substances may be considered as a group or category. Secondly, it is required that the relevant properties of a substance within the group may be predicted from data for reference substance(s) within the group (addressed under 'Assessment of prediction(s)').

Additional information on what is necessary when justifying a read-across approach can be found in the ECHA Guidance R.6. and related documents<sup>2,3</sup>.

#### A. Predictions for (eco)toxicological and fate properties

You have provided a read-across justification document "*Justification for Analogue Approach*" in the CSR in IUCLID Section 13.

You read-across between the structurally similar substances

- (Z)-docos-13-enamide (Erucamide), EC No. 204-009-2 (CAS No. 112-84-5) and
- Amides, C16-18 (even numbered), EC No. 931-695-7 (CAS No. 63163-80-4) but identified with its previous identifiers in the robust study summaries of the source studies, i.e. Stearamide, EC No. 204-693-2 (CAS No. 124-26-5)

as source substances and the Substance as target substance.

You have provided the following reasoning for the prediction of (eco)toxicological and fate properties:

<sup>2</sup> Read-Across Assessment Framework (RAAF). 2017 (March) ECHA, Helsinki. 60 pp. Available online: [Read-Across Assessment Framework \(https://echa.europa.eu/support/registration/how-to-avoid-unnecessary-testing-on-animals/grouping-of-substances-and-read-across\)](https://echa.europa.eu/support/registration/how-to-avoid-unnecessary-testing-on-animals/grouping-of-substances-and-read-across)

<sup>3</sup> Read-across assessment framework (RAAF) - considerations on multi-constituent substances and UVCBs. 2017 (March) ECHA, Helsinki. 40 pp. Available online: <https://doi.org/10.2823/794394>

- *"The target substance is the amide of a mono-unsaturated fatty acid with a carbon chain length of 18 C-atoms; the source substances are amides of both saturated and unsaturated fatty acids, with carbon chain lengths of C18 and C22, respectively";*
- *"All demonstrate physical chemical characteristics in a comparable range of magnitude";*
- *You consider that the target and source substance have similar environmental fate properties (the substances are according to you readily biodegradable, have a high potential to adsorb to soil and sediment and have a low potential for bioaccumulation);*
- *You consider that the target and source substance show a similar lack of toxicity towards aquatic organisms;*
- *"[...] all substances considered herein are amides of long-chain fatty acids which follow the same metabolic pathways after systemic uptake";*
- *"[...] read-across from the source substance erucamide can even be considered as worst case approach, because erucamide is a worse substrate for FAAH than oleamide, which results in a lower hydrolysis rate (██████, 2000) and, therefore, a higher systemic availability of erucamide";*
- *"Considering the important endogenous functions of the fatty acid amides, the presence of effective and fast metabolic pathways for their inactivation, the fact that their metabolites are educts for the most effective processes of energy production and storage, and the abundant endogenous availability of their metabolites even in the human body, adverse effects after application of fatty acid amides via physiologically relevant routes are not to be expected".*

ECHA understands that you predict the properties of the Substance using a read-across hypothesis which assumes that different compounds have the same type of effects. The properties of your Substance are predicted based on a worst-case approach in case of (Z)-docos-13-enamide (Erucamide) (EC No. 204-009-2 ) as a source substance and to be quantitatively equal to those of the source substance Amides, C16-18 (even numbered) (EC No. 931-695-7) (Stearamide EC No. 204-693-2).

ECHA notes the following shortcomings with regards to predictions of (eco)toxicological and fate properties.

*a) Characterisation of the source substances*

Annex XI, Section 1.5 of the REACH Regulation provides that *"substances whose physicochemical, toxicological and ecotoxicological properties are likely to be similar or follow a regular pattern as a result of structural similarity may be considered as a group."*

According to the Guidance on IRs and CSA, Section R.6, *"the purity and impurity profiles of the substance and the structural analogue need to be assessed", and "the extent to which differences in the purity and impurities are likely to influence the overall toxicity needs to be addressed, and where technically possible, excluded"*. The purity profile and composition can influence the overall toxicity/properties of the Substance and of the source substance(s) (Guidance on IRs and CSA R.6, Section R.6.2.3.1). Therefore, qualitative and quantitative information on the compositions of the Substance and of the source substance(s) must be provided to allow assessing whether the attempted predictions are compromised by the composition and/or impurities.

Furthermore, whenever the Substance and/or the source substance(s) are UVCB (Unknown or Variable composition, Complex reaction products or of Biological materials) substances qualitative compositional information of the individual constituents of the category members needs to be provided; as well as quantitative characterisation in the form of information on

the concentration of the individual constituents of these substances; to the extent that this is measurable (Guidance on IRs and CSA, Section R.6.2.5.5.).

In your read-across justification document, you state that "*Source chemical 1* [i.e. Erucamide] *is a mono-constituent substance; no relevant impurities are included. The concept of impurities does not apply to the target substance and source chemical 2* [i.e. Amides, C16-18 (even numbered)], which are UVCB substances".

The Substance is a UVCB and in Section 1.4 of your registration dossier your report the following information on composition:

- based on GC-MS, the C16, C18 and C18:1 constituents amounts for ■■■% (w/w), ■■■% (w/w) and ■■■% (w/w), respectively (sum: ■■■%; Test material: Armid O, Batch N. 1002140029). Using the same batch, GC-FID indicates the presence of various minor constituents;
- in a GC-FID analysis on Armid O (batch number: 0904140032), similar quantitative results were obtained for the three main constituents. Two main unidentified constituents were detected at ■■■ and ■■■% (w/w), respectively, which likely correspond to amides with C length < C16 and/or corresponding nitriles and/or diunsaturated nitriles (nitriles being common impurities found in aliphatic primary amides).

For the source substance you have provided limited information in your justification document, including a general statement on purity. For some of the source studies, you have provided some description of the test material. However, this information is not provided for all sources studies and lacks either the distribution of C-chain length of the test material or information on impurities (in particular on the presence of fatty nitriles).

Without this information, no qualitative or quantitative comparative assessment of the compositions of the Substance and of the source substances can be completed. Therefore, it is not possible to assess whether the attempted predictions are compromised by the composition of the source substances.

#### *b) Supporting information*

Annex XI, Section 1.5 of the REACH Regulation states that "*physicochemical properties, human health effects and environmental effects or environmental fate may be predicted from data for reference substance(s)*". For this purpose "*it is important to provide supporting information to strengthen the rationale for the read-across*" (Guidance on IRs and CSA R.6, Section R.6.2.2.1.f.). The set of supporting information should allow to verify the crucial aspects of the read-across hypothesis and establish that the properties of the Substance can be predicted from the data on the source substance(s).

As indicated above, your read-across hypothesis for Erucamide (EC No. 204-009-2 ) is based on the assumption that the source substance constitutes a worst-case for the prediction of the property under consideration of the Substance. For Amides, C16-18 (even numbered) (EC No. 931-695-7), your read-across hypothesis is based on the assumption that the structurally similar substances cause the same type of effect(s). In this context, relevant, reliable and adequate information allowing to compare the properties of the Substance and of the source substance is necessary to confirm the read-across hypotheses specified above.

#### *i. Predictions of toxicity*

Supporting information must include bridging studies to compare properties of the Substance and source substances and information to confirm that the target and

source substances have similar bioavailability and that Erucamide (EC No. 204-009-2) can be considered a worst-case with regard to systemic exposure and toxicity.

In your registration dossier, you have provided *in vivo* skin sensitisation study, *in vitro* cytogenicity and gene mutation studies in mammalian cells, and a 28-d repeated dose toxicity study with the main source substance, Erucamide (EC No. 204-009-2). You have also provided an *in vitro* gene mutation study in bacteria on Amides, C16-18 (even numbered) (EC No. 204-693-2). You have not provided any further endpoint-specific supporting information for the toxicological information requirements listed above. In addition, ECHA notes that your dossier does not contain any studies on either the target or source substances for sub-chronic (90 days) repeated-dose toxicity or pre-natal developmental toxicity.

In your read-across justification document, you refer to common metabolic pathways of long fatty acid amides including the Substance and source substances after systemic uptake. The first step in the metabolism is the hydrolysis of the fatty acid amides by FAAH (fatty acid amide hydrolase) to corresponding fatty acid. In the next step, the free fatty acids are subjected to beta oxidation and energy production. You conclude "*adverse effects after application of fatty acid amides via physiologically relevant routes are not to be expected.*". Furthermore, you consider prediction from Erucamide as a worst-case "*because erucamide is a worse substrate for FAAH than oleamide, which results in a lower hydrolysis rate [...] and, therefore, a higher systemic availability of erucamide*". However, your dossier does not include supporting information to compare overall systemic uptake, and toxicokinetics and toxicodynamics of the target and source substances.

On this basis, the data set reported in the technical dossier does not include relevant, reliable and adequate information for the Substance and of the source substance(s) to support your read-across hypothesis.

ii. Prediction of aquatic toxicity

Supporting information must include bridging studies to compare properties of the Substance and source substances.

For the predictions of long term toxicity to aquatic invertebrates and long term toxicity to fish, you provide the studies used in the prediction in the registration dossier. You also provided short-term toxicity studies on fish and aquatic invertebrates for a substance that you consider representative of the Substance (identified as octadec-9-enamide with EC No. 206-103-9 (CAS No. 301-102-0)) as well as for the source substance. You have not provided any further supporting information.

For the prediction of long-term toxicity to invertebrates and fish, the provided short-term toxicity studies cannot be regarded as a reliable basis to compare the properties of the Substance and of the source substance. This is because poorly water soluble substances (i.e. water solubility below 1 mg/L or below the detection limit of the analytical method of the test material; ECHA Guidance R.7.8.5), such as the Substance and the selected source substance, require longer time to reach steady-state conditions. As a result, short-term tests do not give a true measure of toxicity for this type of substances and therefore do not provide a reliable basis to inform on the relative toxicity of the Substance and the source substance.

iii. Prediction of ready biodegradability

For ready biodegradability support information could be information to confirm similar bioavailability and similar degradation rates under relevant conditions between the Substance and the source substance.

For the source substance, you provide the studies used in the prediction in the registration dossier. Apart from these studies, your read-across justification or the registration dossier does not include any supporting information that would confirm similar bioavailability of similar degradation rates under relevant conditions.

In the absence of the above information, you have not established that the Substance and the source substance(s) are likely to have similar properties. Therefore you have not provided sufficient supporting information to strengthen the rationale for the read-across.

*c) Adequacy and reliability of source studies*

According to Annex XI, Section 1.5., if the grouping concept is applied then in all cases the results to be read across must:

- be adequate for the purpose of classification and labelling and/or risk assessment;
- have adequate and reliable coverage of the key parameters addressed in the corresponding test method referred to in Article 13(3).

Specific reasons why the studies on the source substances do not meet these criteria are explained further below under the applicable information requirement sections A.1., A.2., A.4., A.5., B.2., B.3 and C.4. Therefore, no reliable predictions can be made for these information requirements.

In addition, you have not provided any studies on the source substance(s) for the following endpoints:

- Sub-chronic toxicity study (90-day), (Annex IX, Section 8.6.2.)
- Pre-natal developmental toxicity study (Annex IX, Section 8.7.2.)

**B. Conclusions on the read-across approach**

As explained above, you have not established that relevant properties of the Substance can be predicted from data on the analogue substance. Therefore, your adaptation does not comply with the general rules of adaptation as set out in Annex XI, Section 1.5. and your grouping and read-across approach is rejected.

## Appendix A: Reasons to request information required under Annex VII of REACH

### 1. Skin sensitisation

Skin sensitisation is an information requirement under Annex VII to REACH (Section 8.3.). Under Section 8.3., Column 1, the registrants must submit information allowing (1) A) a conclusion whether the substance is a skin sensitiser and B) whether it can be presumed to have the potential to produce significant sensitisation in humans (Cat. 1A), and (2) risk assessment, where required.

You have adapted this information requirement under Annex XI, Section 1.5. ('Grouping of substances and read-across approach'). In support of your adaptation, you have provided the following information:

- i. a key study according to OECD TG 429 with an analogue substance Erucamide (EC 204-009-2, CAS 112-84-5)

We have assessed this information and identified the following issues:

#### A) Assessment whether the Substance causes skin sensitisation

##### A. Read-across rejection

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected for the study (i).

Therefore study (i) cannot be taken into account in the assessment of whether the Substance causes skin sensitisation.

In addition, the following endpoint-specific deficiency has been identified in your read-across adaptation:

##### B. Non-compliant study

As explained in the Appendix on Reasons common to several requests, the results to be read across must have an adequate and reliable coverage of the key parameters addressed in the corresponding test method referred to in Article 13(3), in this case OECD TG 429. Therefore, the following specifications must be met:

- highest concentration is the highest technically possible concentration that maximises exposure while avoiding systemic toxicity and/or excessive local skin irritation (OECD TG 429, paragraph 18)
- Justification for the choice of vehicle, if another than the recommended vehicle is used (OECD TG 429, paragraph 19)

In the provided study:

- No dose level selection rationale was provided for selecting the highest dose of 25%.
- No justification was provided for the use of tetrahydrofuran as a vehicle, which is not a recommended vehicle.

Therefore the study (i) does not fulfil cover the specifications required by the EU method B.42/OECD TG 429 and cannot be taken into account in the assessment of whether the Substance causes skin sensitisation.

Based on the above, the information submitted does not enable to conclude whether the

Substance causes skin sensitisation.

**B) Assessment whether the Substance can be presumed to have the potential to produce significant sensitisation in humans (Cat. 1A)**

*No assessment of potency*

To be considered compliant and enable concluding whether the Substance causes skin sensitisation, in case the substance is considered to cause skin sensitisation the information provided must allow a conclusion whether it can be presumed to have the potential to produce significant sensitisation in humans (Cat. 1A).

As the currently available data does not allow to conclude whether the Substance causes skin sensitisation (see section A. above), this condition cannot be assessed.

On this basis, the information requirement is not fulfilled.

*Study design*

To fulfil the information requirement for the Substance for skin sensitisation, *in vitro/in chemico* studies (OECD TG 442C, OECD TG 442D and EU Method B.71/OECD TG 442E) are considered suitable. In case *in vitro/in chemico* methods are not suitable for the Substance or the results cannot be used for classification and risk assessment an *in vivo* skin sensitisation study must be performed and the murine local lymph node assay (LLNA) (EU Method B.42/OECD TG 429) is considered as the appropriate study.

**2. In vitro gene mutation study in bacteria**

An *in vitro* gene mutation study in bacteria is an information requirement under Annex VII to REACH (Section 8.4.1.).

You have adapted this information requirement under Annex XI, Section 1.5. ('Grouping of substances and read-across approach'). In support of your adaptation, you have provided the following information:

- i. a key study similar to OECD TG 471 with an analogue substance Stearamide (EC 204-693-2, CAS 124-26-5) in *S. typhimurium* strains TA 1535, TA 1537, TA 1538, TA 98 and TA 100, which all gave negative results

We have assessed this information and identified the following issues:

*A. Read-across rejection*

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected.

In addition, the following endpoint-specific deficiency has been identified in your read-across adaptation:

*B. Non-compliant study*

As explained in the Appendix on Reasons common to several requests, the results to be read across must provide adequate and reliable coverage of the key parameters addressed in the corresponding test method referred to in Article 13(3), in this case OECD TG 471. Therefore, the following specifications must be met:

- The test must be performed with 5 strains: four strains of *S. typhimurium* (TA98; TA100; TA1535; TA1537 or TA97a or TA97) and one strain which is either *S. typhimurium* TA102 or *E. coli* WP2 uvrA or *E. coli* WP2 uvrA (pKM101)
- One positive control must be included in the study. The positive control substance must produce a statistically significant increase in the number of revertant colonies per plate compared with the concurrent negative control.
- The number of revertant colonies per plate for the concurrent negative control must be inside the historical control range of the laboratory.
- The mean number of revertant colonies per plate must be reported for the treated doses and the controls.

However, the reported data for the study you have provided did not include:

- The required fifth strain, *S. typhimurium* TA102 or *E. coli* WP2 uvrA or *E. coli* WP2 uvrA (pKM101)
- Information whether positive control(s) produced statistically significant increase in the number of revertant colonies per plate compared with the concurrent negative control.
- Information whether the number of revertant colonies for negative control is inside the historical control range of the laboratory
- Data on the number of revertant colonies per plate for the treated doses and the controls

The information provided does not cover the specifications required by the OECD TG 471.

On this basis, the information requirement is not fulfilled.

#### *Study design*

To fulfil the information requirement for the Substance, the *in vitro* gene mutation study in bacteria (OECD TG 471) is considered suitable.

### **3. Long-term toxicity testing on aquatic invertebrates**

Short-term toxicity testing on aquatic invertebrates is an information requirement under Annex VII to REACH (Section 9.1.1.). Long-term toxicity testing on aquatic invertebrates must be considered (Section 9.1.1., Column 2) if the substance is poorly water soluble.

Poorly water soluble substances require longer time to reach steady-state conditions. As a result, the short-term tests do not give a true measure of toxicity for this type of substances and the long-term test is required. A substance is regarded as poorly water soluble if, for instance, it has a water solubility below 1 mg/L or below the detection limit of the analytical method of the test material (ECHA Guidance R.7.8.5).

In an EU Method A.6 study (based on the column elution method), the saturation concentration in water of a substance that you consider representative of the Substance (identified as octadec-9-enamide with EC No. 206-103-9 (CAS No. 301-102-0)) was determined to be 1.6 - 1.7 µg/L (22°C, pH 6.7).

Therefore, the Substance is poorly water soluble and information on long-term toxicity on aquatic invertebrates must be provided.

The examination of the information provided, as well as the selection of the requested test and the test design are addressed under Appendix C.3.

#### 4. Growth inhibition study aquatic plants

Growth inhibition study aquatic plants is an information requirement under Annex VII to REACH (Section 9.1.2.).

You have provided the following information:

- i. a growth inhibition study on algae according to OECD TG 201 claimed to be conducted on the Substance

We have assessed this information and identified the following issues:

*A. The identity of the test material cannot be verified*

To comply with this information requirement, the test material in a study must be representative for the Substance (Article 10 and Recital 19 of REACH; ECHA Guidance R.4.1).

For study i. above, you have identified the test material as "Oleamide" with a purity of > 99% and you refer to EC No. 206-103-9 (CAS No. 301-02-0). However, you provided no further information, including composition.

In the absence of composition information on the test material, the identity of the test material and its impurities cannot be assessed, and you have not demonstrated that the test material is representative for the Substance. Therefore, the information provided is rejected.

*B. The provided study is not reliable*

To fulfil the information requirement, a study must comply with OECD TG 201 and the requirements of OECD GD 23 (ENV/JM/MONO(2000)6/REV1) if the substance is difficult to test (Article 13(3) of REACH). Therefore, the following specifications must be met:

*Additional requirements applicable to difficult to test substances*

- a) if the test material is poorly water soluble, the maximum dissolved concentration that can be achieved in the specific test solution under the test conditions is determined;
- b) if the test material is tested at the saturation concentration, evidence must be provided that all reasonable efforts have been taken to achieve a saturation concentration, which include:
  - 1) an analytical method validation report demonstrating that the analytical method is appropriate, and
  - 2) information on the saturation concentrations of the test material in water and in the test solution, and
  - 3) a description of the method used to prepare the test solution, and
  - 4) the results of a preliminary experiment demonstrating that the test solution preparation method is adequate to maximize the concentration of the test material in solution;

*Reporting of the methodology and results*

- c) adequate information on the analytical method (including performance parameters of the method) and on the results of the analytical determination of exposure concentrations is provided.

Your registration dossier provides an OECD TG 201 showing the following:

*Additional requirements applicable to difficult to test substances*

- a) the test material is poorly water soluble (water solubility determined to be 1.6 - 1.7 µg/L (22°C, pH 6.7) based on EU Method A.6 using data from octadec-9-enamide with EC No. 206-103-9 (CAS No. 301-102-0)). You have not provided an estimate of the maximum dissolved concentration that can be achieved in the specific test solution under the test conditions;
- b) you report that the test was conducted at nominal concentrations of 1, 3.2, 10, 32 and 100 mg/L which indicates that you intended to test the test material at its saturation concentration. However, you have provided none of the information listed under point b) above to support that saturation was achieved;

*Reporting of the methodology and results*

- c) you have provided no information on the analytical method (including performance parameters of the method). In addition, the results of the analytical determination of exposure concentration is not reported in an unambiguous way (i.e. table showing measured values in each replicate and each interval of sampling)

Based on the above,

- the Substance is difficult to test (low water solubility and high adsorptive properties) and there are critical methodological deficiencies resulting in the rejection of the study results. More specifically, you have not provided adequate information on the saturation concentration of the test material in the test medium used to conduct testing also taking into account the UVCB nature of the Substance. In addition, you have not provided any information to support that the test procedure was adequate to maximize exposure to the test material.
- independent of the above issue, the reporting of the study is not sufficient to conduct an independent assessment of its reliability. More specifically, no information is provided on the performance parameters of the analytical method.

Therefore, this study does not meet the requirements of OECD TG 201 in conjunction with OECD GD 23.

On this basis, the information requirement is not fulfilled.

*Study design*

The Substance is difficult to test due to its low water solubility (1.6 - 1.7 µg/L ; EU Method A.6 using data from octadec-9-enamide with EC No. 206-103-9 (CAS No. 301-102-0)) and high adsorptive properties (log Kow = 6.48 based on a weight of evidence approach). OECD TG 201 specifies that, for difficult to test substances, you must consider the approach described in OECD GD 23 or other approaches, if more appropriate for your substance. In all cases, the approach selected must be justified and documented. Due to the properties of Substance, it may be difficult to achieve and maintain the desired exposure concentrations. Therefore, you must monitor the test concentration(s) of the Substance throughout the exposure duration and report the results. If it is not possible to demonstrate the stability of exposure concentrations (i.e. measured concentration(s) not within 80-120% of the nominal concentration(s)), you must express the effect concentration based on measured values as described in OECD TG 201. In case a dose-response relationship cannot be established (no observed effects), you must demonstrate that the approach used to prepare test solutions was adequate to maximise the concentration of the Substance in the test solution.

For multi-constituents/UVCBs, the analytical method must be adequate to monitor qualitative and quantitative changes in exposure to the dissolved fraction of the test material during the test (e.g. by comparing mass spectral full-scan GC or HPLC chromatogram peak areas or by using targeted measures of key constituents or groups of constituents).

If you decide to use the Water Accommodated Fraction (WAF) approach, in addition to the above, you must:

- use loading rates that are sufficiently low to be in the solubility range of most constituents (or that are consistent with the PEC value). This condition is mandatory to provide relevant information for the hazard and risk assessment (ECHA Guidance, Appendix R.7.8.1-1, Table R.7.8-3);
- provide a full description of the method used to prepare the WAF (including, among others, loading rates, details on the mixing procedure, method to separate any remaining non-dissolved test material including a justification for the separation technique);
- prepare WAFs separately for each dose level (i.e. loading rate) and in a consistent manner.

## 5. Ready biodegradability

Ready biodegradability is an information requirement in Annex VII to REACH (Section 9.2.1.1.).

You have provided an adaptation under Annex XI, Section 1.5. ('Grouping of substances and read-across approach'). In support of your adaptation you provided the following information:

- i. a ready biodegradability study according to OECD TG 301B with the source substance Amides, C16-18 (even numbered), EC No. 931-695-7 (CAS No. 63163-80-4) (2001).
- ii. a ready biodegradability study according to OECD TG 301B with the source substance (Z)-docos-13-enamide, EC No. 204-009-2 (CAS No. 112-84-5) (2001).

You also provided an adaptation under Annex XI, Section 1.3. ('(Q)SAR'). In support of your adaptation you provided the following information:

- iii. Predictions from BIOWIN v4.10 for the C18 unsaturated (i.e. oleamide).

We have assessed this information and identified the following issues:

### A. Read-across rejection

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected.

Therefore, studies i. and ii. cannot be taken into account in the assessment of whether the Substance is readily biodegradable.

In addition, the following endpoint-specific deficiency has been identified in your read-across adaptation:

### B. The study i. above is not reliable

As explained in the Appendix on Reasons common to several request, under Annex XI, Section 1.5., the results to be read across must have an adequate and reliable coverage of the key parameters addressed in the corresponding test method referred to in Article 13(3), in this case OECD TG 301 or OECD TG 310. Therefore, for a study according to OECD TG 301B, the following requirements must be met:

*Validity criteria*

- a) The difference of extremes of replicate values of the removal of the test material at the plateau, at the end of the test or, if appropriate, at the end of the 10-d window is  $\leq 20\%$ ;
- b) The inorganic carbon content (IC) of the test material suspension in the mineral medium at the beginning of the test is  $< 5\%$  of the total carbon (TC);
- c) The total CO<sub>2</sub> evolution in the inoculum blank at the end of the test does not normally exceed 40 mg CO<sub>2</sub>/L;

*Technical specifications impacting the sensitivity/reliability of the test*

- d) The concentration of the inoculum is set to reach a bacterial cell density of 10<sup>7</sup> to 10<sup>8</sup> cells/L in the test vessel. The suspended solid concentration is  $\leq 30$  mg/L.

*Reporting of the methodology and results*

- e) The source of the inoculum, its concentration in the test and any pre-conditioning treatment are reported;
- f) The calculation of the ThCO<sub>2</sub> is described and justified;
- g) The inorganic carbon content (IC) and total carbon content (TC) of the test material suspension in the mineral medium at the beginning of the test is reported;
- h) The results of measurements at each sampling point in each replicate is reported in a tabular form.

Your registration dossier provides an OECD TG 301B (study i.) showing the following:

*Reporting of the methodology and results*

- e) You report that the suspended solid concentration was 30 mg/L. However, you have not provided information on inoculum density in cells/mL;
- f) the calculation of the ThCO<sub>2</sub> is not described;
- g) the inorganic carbon content (IC) and total carbon content (TC) of the test material suspension in the mineral medium at the beginning of the test is not reported;
- h) the results of measurements at each sampling point in each replicate is not reported.

Based on the above, the reporting of the study is not sufficient to conduct an independent assessment of its reliability. More specifically, as you have not provided adequate information on inoculum density (see point e) above) it is not possible to verify whether the test was conducted in compliance with the technical specifications of OECD TG 301B (see point d) above). Then, you have not provided an adequate reporting of the study results (in particular see point g) and h)) and it is not possible to verify that the validity criteria specified under points a) to c) above were met. Finally, since you have not described how the ThCO<sub>2</sub> was determined and you have not provided the raw data obtained in the test, it is not possible to verify the validity of the interpretation of the results.

Therefore, study i. does not meet the requirements of OECD TG 301B.

C. Currently available QSAR have insufficient accuracy to predict rapid degradation

ECHA Guidance R.7.9.5.1. specifies that (Q)SARs for predicting ready biodegradation are not sufficiently accurate to predict rapid degradation (including BIOWIN v4.10). However, when no useful information on degradability is available (either

experimentally derived or estimated), (Q)SAR predictions can be used as supporting evidence of that the substance is not rapidly degradable.

Your dossier only includes predictions from BIOWIN v4.10 for C18 unsaturated (i.e. oleamide) (see study iii. above). Based on this information and other rejected sources of information, you conclude that the Substance is readily biodegradable. As explained above, (Q)SARs predictions are not adequate to conclude on rapid degradation for the Substance. Therefore, this information on its own does not fulfil the information requirement and your adaptation is rejected.

On this basis, the information requirement is not fulfilled.

## Appendix B: Reasons to request information required under Annex VIII of REACH

### 1. *In vitro* cytogenicity study in mammalian cells or *In vitro* micronucleus study

An *in vitro* cytogenicity study in mammalian cells or an *in vitro* micronucleus study is an information requirement under Annex VIII to REACH (Section 8.4.2.).

You have adapted this information requirement under Annex XI, Section 1.5. ('Grouping of substance and read-across'). In support of your adaptation, you have provided the following information:

- i. A key study according to OECD TG 473 with an analogue substance Erucamide (EC 204-009-2, CAS 112-84-5)

We have assessed this information and identified the following issue:

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected.

On this basis, the information requirement is not fulfilled.

#### *Study design*

To fulfil the information requirement for the Substance, either *in vitro* cytogenicity study in mammalian cells (Annex VIII, Section 8.4.2., test method OECD TG 473) or *in vitro* micronucleus study (Annex VIII, Section 8.4.2., test method OECD TG 487) are considered suitable.

### 2. *In vitro* gene mutation study in mammalian cells

An *in vitro* gene mutation study in mammalian cells is an information requirement under Annex VIII to REACH (Section 8.4.3.) in case of a negative result in the *in vitro* gene mutation test in bacteria and the *in vitro* cytogenicity test.

#### *i. Triggering of the study*

Your dossier contains an adaptation for an *in vitro* gene mutation study in bacteria, and an adaptation for an *in vitro* cytogenicity study in mammalian cells.

The information for the *in vitro* gene mutation study in bacteria and for the *in vitro* cytogenicity study in mammalian cells provided in the dossier are rejected for the reasons provided in Appendix A.2. and Appendix B.1., respectively.

The result of the requests for information in Section A.2 and in Section B.1 will determine whether the present requirement for an *in vitro* mammalian cell gene mutation study in accordance with Annex VIII, Section 8.4.3 is triggered.

#### *ii. Assessment of information provided*

You have adapted this information requirement under Annex XI, Section 1.5. ('Grouping of substance and read-across'). In support of you adaptation, you have provided the following information:

- i. a key study according to OECD TG 476 with an analogue substance Erucamide (EC 204-009-2, CAS 112-84-5)

We have assessed this information and identified the following issues:

*A. Read-across rejection*

For the reasons explained in the Appendix on Reasons common to several requests your read-across adaptation is rejected.

In addition, the following endpoint-specific deficiency has been identified in your read-across adaptation:

*B. Non-compliant study*

As explained in the Appendix of Reasons common to several requests, the results to be read across must provide adequate and reliable coverage of the key parameters addressed in the corresponding test method referred to in Article 13(3), in this case OECD TG 476. Therefore, the following specifications must be met:

- a) The maximum concentration tested must induce 80-90% of cytotoxicity compared to the negative control, or the precipitation of the tested substance. If no precipitate or limiting cytotoxicity is observed, the highest test concentration must correspond to 10 mM, 2 mg/mL or 2 µL/mL, whichever is the lowest.
- b) At least 4 concentrations must be evaluated, in each test condition. In case of poorly soluble substances OECD TG 476 states "*the highest concentration analysed should produce turbidity or a precipitate*".
- c) The response for the concurrent negative control must be inside the historical control range of the laboratory.
- d) Data on the cytotoxicity and the mutation frequency for the treated and control cultures must be reported.

In the provided study:

- a) The concentrations tested in the definitive test were 4.7, 9.4, 18.8, 37.5, 75 and 150 µg/ml. You specified that "precipitation was observed at concentrations of 18.8 µg/ml and above".
- b) In the definitive test, only two concentrations did not cause precipitation.
- c) You have not provided any information on historical control and whether the concurrent controls were inside the historical control range of the laboratory.
- d) You reported the mutation frequencies as a range. Especially, the information on mutation frequency per treated cultures is missing.

The information provided does not cover the specifications required by the OECD TG 476.

On this basis, the provided study is not regarded as providing reliable information to inform on the properties of the Substance. Therefore, the information requirement is not fulfilled.

Consequently, you are required to provide information for this endpoint if the *in vitro* gene mutation study in bacteria and the *in vitro* cytogenicity study in mammalian cells or an *in vitro* micronucleus study provide a negative result.

*Study design*

To fulfil the information requirement for the Substance, either the *in vitro* mammalian cell gene mutation tests using the hprt and xprt genes (OECD TG 476) or the thymidine kinase gene (OECD TG 490) are considered suitable.

### **3. Justification for an adaptation of a Short-term repeated dose toxicity (28 days) based on the results of the Sub-chronic toxicity study (90 days)**

A Short-term repeated dose toxicity study (28 days) is an information requirement under Annex VIII to REACH (Section 8.6.1.). This information may take the form of a study record or a valid adaptation in accordance with either a specific adaptation rule under Column 2 of Annex VIII or a general adaptation rule under Annex XI.

You have adapted this information requirement under Annex XI, Section 1.5. ('Grouping of substance and read-across'). In support of your adaptation, you have provided the following information:

- i. A non-guideline 28-day repeated dose toxicity study via oral route in male rats with an analogue substance Erucamide (EC 204-009-2, CAS 112-84-5)

We have assessed this information and identified the following issues:

#### *A. Read-across rejection*

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected.

In addition, the following endpoint-specific deficiency has been identified in your read-across adaptation:

#### *B. Non-compliant study*

As explained in the Appendix on Reasons common to several requests, the results to be read across must have an adequate and reliable coverage of the key parameters addressed in the corresponding test method referred to in Article 13(3), in this case OECD TG 407. Therefore, the following specifications must be met:

- a) Testing of at least three dose levels and a concurrent control
- b) 5 female and 5 male animals should be used at each dose level (including control group)
- c) Examination of the animals for weight and histopathology (including weight and histopathology of the thyroid gland, thyroid hormone measurements, organ weight measurements, body weight measurements, examination of the clinical signs, examination of the animals for gross pathology of organs and tissues)

You have provided a study showing the following:

- a) The study you have provided was conducted with only one dose level.
- b) The study you have provided was conducted with only 5 male animals per test dose group.
- c) The following key parameters are missing: weight and histopathology of the thyroid gland has not been measured, thyroid hormone measurements have not been conducted, the organs weights have not been measured, the body weight has not been reported, the clinical signs have not been reported, gross pathology of organs and tissues has not been reported.

Therefore, the study submitted in your adaptation, as currently reported in your dossier, does not cover the specifications of the corresponding OECD TG.

On this basis, the information requirement is not fulfilled.

Column 2 of Annex VIII, Section 8.6.1. provides that an experimental study for this endpoint

is not needed if a reliable sub-chronic (90 days) or chronic toxicity study is available.

The present decision requests the registrants concerned to generate and submit a reliable sub-chronic toxicity study (90 days) (see Appendix C.1). According to Column 2 of Annex VIII, Section 8.6.1., and to prevent unnecessary animal testing, a short term toxicity study (28 days) does not therefore need to be conducted.

Because you still must comply with the information requirement in Annex VIII, Section 8.6.1., you are requested to submit a justification for the adaptation provided in Column 2 of that provision.

#### **4. Long-term toxicity testing on fish**

Short-term toxicity testing on fish is an information requirement under Annex VIII to REACH (Section 9.1.3.). Long-term toxicity testing on fish must be considered (Section 9.1.3., Column 2) if the substance is poorly water soluble.

Poorly water soluble substances require longer time to reach steady-state conditions. As a result, the short-term tests do not give a true measure of toxicity for this type of substances and the long-term test is required. A substance is regarded as poorly water soluble if, for instance, it has a water solubility below 1 mg/L or below the detection limit of the analytical method of the test material (ECHA Guidance R.7.8.5).

In an EU Method A.6 study (based on the column elution method), the saturation concentration in water of a substance that you consider representative of the Substance (identified as octadec-9-enamide with EC No. 206-103-9 (CAS No. 301-102-0)) was determined to be 1.6 - 1.7 µg/L (22°C, pH 6.7).

Therefore, the Substance is poorly water soluble and information on long-term toxicity on fish must be provided.

The examination of the information provided, as well as the selection of the requested test and the test design are addressed under Appendix C.4.

## Appendix C: Reasons to request information required under Annex IX of REACH

### 1. Sub-chronic toxicity study (90-day)

A Sub-chronic toxicity study (90 day) is an information requirement under Annex IX to REACH (Section 8.6.2.).

You have adapted this information requirement under Annex XI, Section 1.5. ('Grouping of substance and read-across'). In support of your adaptation, you have provided the following statement: "*A subchronic toxicity study with a structurally related substance (CAS 112-84-5, erucamide) via the oral route in rodents is proposed by the respective Lead Registrant, which will be used for read-across.*"

We have assessed this information and identified the following issues:

#### A. Read-across rejection

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected.

In addition, the following endpoint-specific deficiency has been identified in your read-across adaptation:

#### B. Non-compliant study

You have not provided a Sub-chronic toxicity study (90 day) (OECD TG 408) in your registration dossier nor a testing proposal in accordance with Articles 10(a)(ix) and the format set under 111 of REACH but only an intention to submit a future study on an analogue substance.

On this basis, the information requirement is not fulfilled.

#### Study design

Referring to the criteria provided in Annex IX, Section 8.6.2, Column 2, the oral route is the most appropriate route of administration to investigate repeated dose toxicity, because the Substance is reported to occur as a dust without a significant proportion (>1% on weight basis) of particles of inhalable size (MMAD < 50 µm). No particles with a size smaller than 1400 µm were reported for the main constituent of the Substance (70-95% of Oleamide).

Therefore, the sub-chronic toxicity study must be performed according to the OECD TG 408, in rats and with oral administration of the Substance.

### 2. Pre-natal developmental toxicity study in one species

A Pre-natal developmental toxicity (PNDT) study (OECD TG 414) in one species is an information requirement under Annex IX to REACH (Section 8.7.2.).

You have adapted this information requirement under Annex XI, Section 1.5. ('Grouping of substance and read-across'). In support of your adaptation, you have provided the following statement: "*A prenatal developmental toxicity study with a structurally related substance (CAS 112-84-5, erucamide) via the oral route in rodents is proposed by the respective Lead Registrant, which will be used for read-across.*"

We have assessed this information and identified the following issues:

#### A. Read-across rejection

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected.

In addition, the following endpoint-specific deficiency has been identified in your read-across adaptation:

#### B. Non-compliant study

You have not provided a Pre-natal developmental toxicity (PNDT) study (OECD TG 414) in your registration dossier nor a testing proposal in accordance with Articles 10(a)(ix) and the format set under 111 of REACH but only an intention to submit a future study on an analogue substance.

On this basis, the information requirement is not fulfilled.

#### *Study design*

A PNDT study according to the test method OECD TG 414 must be performed in rat or rabbit as preferred species with oral administration (ECHA Guidance R.7.6.2.3.2.) of the Substance.

### 3. Long-term toxicity testing on aquatic invertebrates

Long-term toxicity testing on aquatic invertebrates is an information requirement under Annex IX to REACH (Section 9.1.5.).

You have adapted this information requirement under Annex XI, Section 1.5. ('Grouping of substances and read-across approach'). In support of your adaptation you provided the following information:

- i. a long-term toxicity study on aquatic invertebrates according to OECD TG 202 (1984) with the source substance Erucamide, EC No. 204-009-2 (CAS No. 112-84-5).

We have assessed this information and identified the following issue:

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected.

Therefore study i. cannot be taken into account in the assessment of long-term toxicity on aquatic invertebrates.

On this basis, the information requirement is not fulfilled.

#### *Study design*

OECD TG 211 specifies that for difficult to test substances OECD GD 23 must be followed. As already explained above, the Substance is difficult to test. Therefore, you must fulfil the requirements described in 'Study design' under Appendix A.4.

### 4. Long-term toxicity testing on fish

Long-term toxicity testing on fish is an information requirement under Annex IX to REACH (Section 9.1.6.).

You have provided an adaptation under Annex XI, Section 1.5. ('Grouping of substances and read-across approach'). In support of your adaptation you provided the following information:

- i. a fish, juvenile growth test according to OECD TG 215 with the source substance Erucamide, EC No. 204-009-2 (CAS No. 112-84-5).

We have assessed this information and identified the following issues:

*A. Read-across rejection*

As explained in the Appendix on Reasons common to several requests your read-across adaptation under Annex XI, Section 1.5. is rejected for the studies (i).

Therefore study i. cannot be taken into account in the assessment of long-term toxicity on fish.

In addition, the following endpoint-specific deficiency has been identified in your read-across adaptation:

*B. The study on the source substance is not reliable*

As explained in the Appendix on Reasons common to several request, under Annex XI, Section 1.5., the results to be read across must have an adequate and reliable coverage of the key parameters addressed in the corresponding test method referred to in Article 13(3).

The Fish Early Life Stage (FELS) toxicity test (test method: OECD TG 210) is the most suitable test guideline for addressing long-term toxicity on fish for most substances (ECHA Guidance R.7.8.2.). As specified in ECHA Guidance R.7.8.2., the Fish, Juvenile Growth Test (test method: OECD TG 215) is only considered as an acceptable test method if the following cumulative conditions are met:

- a) a well-founded justification is provided to support that growth inhibition is the most relevant effect in fish, and
- b) the substance has a log Kow < 5.

Otherwise, OECD TG 215 could underestimate long-term toxicity in fish and not achieve the REACH objective of protection of the environment nor would the study be appropriate for classification and labelling and risk assessment.

You have provided no justification as to why growth inhibition is the most relevant effect in fish for the selected source substance. Further, in your read-across justification document, you report that the log Kow of the source substance is 8.

Therefore, the OECD TG 215 is not regarded as an acceptable test method for the source substance and a Fish Early Life Stage (FELS) toxicity test (test method: OECD TG 210) would need to be provided instead.

On this basis, the information requirement is not fulfilled.

*Study design*

To fulfil the information requirement for the Substance, the Fish, Early-life Stage Toxicity Test (test method OECD TG 210) is the most appropriate (ECHA Guidance R.7.8.2.).

OECD TG 210 specifies that for difficult to test substances OECD GD 23 must be followed. As already explained above, the Substance is difficult to test. Therefore, you must fulfil the requirements described in 'Study design' under Appendix A.4.

## 5. Long-term toxicity on terrestrial invertebrates

Short-term toxicity to invertebrates is an information requirement under Annex IX to REACH (Section 9.4.1). Long-term toxicity testing must be considered (Section 9.4., column 2) if the substance has a high potential to adsorb to soil or is very persistent.

Based on the information from your registration dossier:

- the Substance is considered to have high adsorption potential to soil as you report a log K<sub>ow</sub> of 6.48 based on a weight of evidence approach and log K<sub>oc</sub> values of 5.21 based on a study according to OECD TG 121 on octadec-9-enamide with EC No. 206-103-9 (CAS No. 301-102-0).

On this basis information on long-term toxicity on terrestrial invertebrates must be provided.

The examination of the available information or adaptations, as well as the selection of the requested test and the test design are addressed respectively in Appendix D.2.

## 6. Effects on soil micro-organisms

Effects on soil microorganisms is an information requirement under Annex IX to REACH (Section 9.4.2).

We understand that you have adapted this information Under Annex IX, Section 9.4., Column 2 with the following justification: *"In accordance with column 2 of EC 1970/2006 Annex IX the effects of terrestrial organisms need not to be tested if a direct and indirect exposure to the soil compartment is unlikely. As the category members are readily biodegradable an indirect exposure of soil organisms through sludge application can be ruled out. Regarding the very low water solubility (< 0.1 mg/L) it is not likely that the test substances can be found in the aquatic environment in high concentrations and therefore an application due to floods and irrigation can be ruled out. Data from acute and chronic studies afford that there is no toxicity in the range of water solubility for aquatic organisms. Moreover, chronic and acute studies for mammals result in no toxic effects as well. The test substance is not classified and considering that the test substance is readily biodegradable, has very low water solubility (< 0.1 mg/L), is not toxic to aquatic species and mammals and an indirect application to soil via sludge can be ruled out, no soil toxicity data should be generated."*

We have assessed this information and identified the following issue:

Under Annex IX, Section 9.4, Column 2, the study may be omitted if direct and indirect exposure of the soil compartment is unlikely. ECHA Guidance R.11.2.1. specifies that, in general, it is assumed that soil exposure will occur unless:

- 1) it can be shown that there is no sludge application to land from exposed STPs and,
- 2) aerial deposition is negligible and,
- 3) the relevance of other exposure pathways such as irrigation and/or contact with contaminated waste is unlikely.

In the case of readily biodegradable substances which are not directly applied to soil it is generally assumed that the substance will not enter the terrestrial environment and as such there is no need for testing of soil organisms is required.

In Section 3 of your dossier, you report, for instance, widespread outdoor professional and consumer uses in coatings and inks as non-reactive processing aid (ERC 8d) and widespread outdoor consumer use with high intended release in rubber products (ERC 10b). These uses indicate that direct exposure to soil may occur. Also, you have not provided any justification as to why no sludge application to land from exposed STPs would occur and therefore indirect exposure to soil may occur.

The reported uses in your dossier indicates that direct exposure to soil may occur. You also have not provided any justification for point 1) and 2) above. In addition for the reasons explained under Appendix A.5., you have not demonstrated that the Substance is readily biodegradable. Therefore, you have not demonstrated that indirect exposure to soil is unlikely. In any case the information provided on most of the elements of your justification are rejected for the reasons already described in the corresponding Appendix sections.

Therefore, your adaptation is rejected.

On this basis, the information requirement is not fulfilled.

#### *Study design*

ECHA Guidance R.7.11.3.1. specifies that Soil Microorganisms: Nitrogen Transformation Test (EU C.21/OECD TG 216) is considered suitable for assessing long-term adverse effects on soil microorganisms for most non-agrochemicals.

### **7. Long-term toxicity on terrestrial plants**

Short-term toxicity to terrestrial plants is an information requirement under Annex IX to REACH (Section 9.4.3). Long-term toxicity testing must be considered (Section 9.4., column 2) if the substance has a high potential to adsorb to soil or is very persistent.

Based on the information from your registration dossier:

- the Substance is considered to have high adsorption potential to soil as you report a log Kow of 6.48 based on a weight of evidence approach and log Koc values of 5.21 based on a study according to OECD TG 121 on octadec-9-enamide with EC No. 206-103-9 (CAS No. 301-102-0).

On this basis information on long-term toxicity on terrestrial plants must be provided.

The examination of the available information or adaptations, as well as the selection of the requested test and the test design are addressed respectively in Appendix D.3.

**Appendix D: Reasons to request information required under Annex X of REACH****1. Pre-natal developmental toxicity study in a second species**

Pre-natal developmental toxicity (PNDT) studies (OECD TG 414) in two species is an information requirement under Annex X to REACH (Section 8.7.2.).

You have provided an adaptation for PNDT study in one species, i.e. in rodents (See Appendix C.2.)

As you have not provided any information on a second species or any adaptation under column 2 of Section 8.7.2 or under Annex XI, the information requirement is not fulfilled.

*Study design*

A PNDT study according to the OECD TG 414 study must be performed in the rabbit or rat as the preferred second species, depending on the species tested in the first PNDT study (request C.2. in this decision). The study must be performed with oral administration (ECHA Guidance R.7.6.2.3.2) of the Substance.

**2. Long-term toxicity testing on terrestrial invertebrates**

Long-term toxicity to terrestrial invertebrates is an information requirement under Annex IX to REACH (Section 9.4.4).

You have adapted this information Under Annex IX, Section 9.4., Column 2 with the same justification as already described under Appendix C.6.

For the reasons already explained under Appendix C.6., your adaptation is rejected.

On this basis, the information requirement is not fulfilled.

*Study design*

ECHA Guidance R.7.11.3.1. specifies that the earthworm reproduction test (OECD TG 222), the Enchytraeid reproduction test (OECD TG 220), and the Collembolan reproduction test (OECD TG 232) are appropriate to cover the information requirement for long-term toxicity testing on terrestrial invertebrates. ECHA is not in a position to determine the most appropriate test protocol since this decision is dependent upon species sensitivity and substance properties. However, when  $\log K_{ow} > 5$  and  $\log K_{oc} > 4$ , as in this case, the test OECD 232 is not appropriate as the dominant route of exposure for Collembolans is via pore water.

**3. Long-term toxicity testing on terrestrial plants**

Long-term toxicity to terrestrial plants is an information requirement under Annex IX to REACH (Section 9.4.6).

You have adapted this information Under Annex IX, Section 9.4., Column 2 with the same justification as already described under Appendix C.6.

For the reasons already explained under Appendix C.6., your adaptation is rejected.

On this basis, the information requirement is not fulfilled.

### *Study design*

The Terrestrial Plant Test (test method: OECD TG 208) is appropriate to cover the information requirement for long-term toxicity on terrestrial plants.

The OECD TG 208 considers the need to select the number of test species according to relevant regulatory requirements, and the need for a reasonably broad selection of species to account for interspecies sensitivity distribution. For long-term toxicity testing, ECHA considers six species as the minimum to achieve a reasonably broad selection. Testing must be conducted with species from different families, as a minimum with two monocotyledonous species and four dicotyledonous species, selected according to the criteria indicated in the OECD TG 208.

#### **4. Long-term toxicity to sediment organisms**

Long-term toxicity to sediment organisms is an information requirement under Annex X to REACH (Section 9.5.1.).

You have omitted this information with the following justification: *"According to column 2 of EC 1907/2006 Annex IX long-term toxicity testing shall only be proposed if the chemical safety assessment indicates the need to investigate further the effects on aquatic organisms. Oleamide does not need further investigations due to the following reasons. As the test substance is poorly soluble in water (< 0.1 mg/L) it is expected that sediments are, if at all, only exposed to very small amounts of the test substance, as amounts will be present in wastewater, they will be eliminated in common wastewater treatment plants to a large amount due to the readily biodegradability of oleamide. Furthermore, no short and long-term effects were observed to aquatic algae, daphnia and fish in the range of water solubility. Regarding, that only low amounts of the test substance can be expected in the aquatic environment and no long-term tests with sediment organisms should be performed because no effects are expected."*

We have assessed this information and identified the following issue:

Under Section 9.5.1., column 2 of Annex IX, the study can be omitted if the chemical safety assessment does not indicate the need to investigate further the effects of the substance and/or relevant degradation products on sediment organisms. ECHA Guidance R.7.8.10.3 specifies that substances that do not exhibit a toxic effect when tested in water-only test systems because equilibrium was not reached during the exposure phase may nevertheless exert significant toxic effects in sediment tests. This may be especially true for poor water soluble substances with high adsorption potential as the exposure duration in aquatic studies can in some cases be too short to reach steady state conditions for such substances. Therefore, if no effects are observed in pelagic tests, extrapolation from pelagic data to sediment data is not possible and performing a toxicity test on sediment organisms (whole sediment tests) is necessary.

In your justification, you consider that toxicity to sediment organisms is unlikely as a result of the low solubility of the Substance, the fact that you consider the Substance as readily biodegradable, and the lack of effects observed in the reported aquatic toxicity studies. You have not provided a risk characterisation based on the EPM.

The Substance is considered to have high adsorption potential to sediment as you report a log K<sub>ow</sub> of 6.48 based on a weight of evidence approach and log K<sub>oc</sub> values of 5.21 based on a study according to OECD TG 121. Therefore, exposure to the sediment compartment may be expected. Also, for the reasons explained under

Appendix A.5., you have not demonstrated that the Substance is readily biodegradable. Finally, the Substance is poorly water soluble (water solubility determined to be 1.6 - 1.7 µg/L (22°C, pH 6.7) based on EU Method A.6 using data from octadec-9-enamide with EC No. 206-103-9 (CAS No. 301-102-0)).

As explained above, for poorly soluble and highly adsorptive substances such as the Substance, the lack of toxicity observed in aquatic toxicity studies is not a valid justification to exclude toxicity on aquatic organisms. Therefore, your adaptation is rejected.

On this basis, the information requirement is not fulfilled.

#### *Study design*

Sediment-Water Chironomid Toxicity Test Using Spiked Sediment (test method: EU C.27/OECD TG 218) is only appropriate to cover the information requirement for long-term toxicity to sediment organisms for substances which equilibration time (time to reach steady state in the body) is not anticipated to be very long (e.g. not highly lipophilic substance such as substance with log Kow < 5 and log Koc < 3; ECHA Guidance R.7.8.9.1. and R.7.8.14.2.) such as the Substance.

Under section 4.7 of your registration dossier you provide a Log Kow value for the Substance of >6.5 (based on OECD TG 117). Under section 5.4.1 of your registration dossier you provide a Log Koc value for the Substance of >5 (based on OECD TG 121).

Therefore, the equilibration time for the Substance is anticipated to be very long. For such substance, the Sediment-Water Chironomid Life-Cycle Toxicity Test Using Spiked Water or Spiked Sediment (test method: EU C.40/OECD TG 233), which is an extension of the proposed test, must be conducted (ECHA Guidance R.7.8.9.1. and R.7.8.14.2.). Alternatively, you may also consider conducting a Sediment-Water Lumbriculus Toxicity Test Using Spiked Sediment (test method: EU C.35/OECD TG 225).

ECHA Guidance R.7.8.10.1 specifies that spiking the water phase does not accurately represent accumulation processes within the sediment lasting longer than the test period and is only regarded as applicable to simulate pesticide spray drift event and other type of exposure (e.g. chemical spill). For industrial chemicals with continuous and intermittent release, spiking the sediment must be conducted as this approach is intended to simulate accumulated levels of substance persisting in the sediment.

ECHA notes that the Substance has multiple industrial uses (not all of which are closed processes), as well as Article Service Life for both Professional and Consumer uses. Considering the environmental release pattern for the Substance, ECHA concludes that the study must be conducted by spiking the sediment phase.

## **Appendix E: Requirements to fulfil when conducting and reporting new tests for REACH purposes**

### **A. Test methods, GLP requirements and reporting**

1. Under Article 13(3) of REACH, all new data generated as a result of this decision must be conducted according to the test methods laid down in a European Commission Regulation or to international test methods recognised by the Commission or ECHA as being appropriate.
2. Under Article 13(4) of REACH, ecotoxicological and toxicological tests and analyses must be carried out according to the GLP principles (Directive 2004/10/EC) or other international standards recognised by the Commission or ECHA.
3. Under Article 10(a)(vi) and (vii) of REACH, all new data generated as a result of this decision must be reported as study summaries, or as robust study summaries, if required under Annex I of REACH. See ECHA Practical Guide on How to report robust study summaries<sup>4</sup>.

### **B. Test material**

Before generating new data, you must agree within the joint submission on the chemical composition of the material to be tested (Test Material) which must be relevant for all the registrants of the Substance.

1. Selection of the Test material(s)

The Test Material used to generate the new data must be selected taking into account the following:

- the variation in compositions reported by all members of the joint submission,
  - the boundary composition(s) of the Substance,
  - the impact of each constituent/ impurity on the test results for the endpoint to be assessed. For example, if a constituent/ impurity of the Substance is known to have an impact on (eco)toxicity, the selected Test Material must contain that constituent/ impurity.
2. Information on the Test Material needed in the updated dossier
    - You must report the composition of the Test Material selected for each study, under the "Test material information" section, for each respective endpoint study record in IUCLID.
    - The reported composition must include the careful identification and description of the characteristics of the Tests Materials in accordance with OECD GLP (ENV/MC/CHEM(98)16) and EU Test Methods Regulation (EU) 440/2008 (Note, Annex), namely all the constituents must be identified as far as possible as well as their concentration. Also, any constituents that have harmonised classification and labelling according to the CLP Regulation must be identified and quantified using the appropriate analytical methods,
    - The reported composition must also include other parameters relevant for the property to be tested.

With that detailed information, ECHA can confirm whether the Test Material is relevant for the Substance and whether it is suitable for use by all members of the joint submission.

Technical instructions on how to report the above is available in the manual on How to prepare registration and PPORD dossiers<sup>5</sup>.

<sup>4</sup> <https://echa.europa.eu/practical-guides>

<sup>5</sup> <https://echa.europa.eu/manuals>

## **Appendix F: General recommendations when conducting and reporting new tests for REACH purposes**

### **A. Environmental testing for substances containing multiple constituents**

Your Substance contains multiple constituents and, as indicated in ECHA Guidance R.11 (Section R.11.4.2.2), you are advised to consider the following approaches for persistency, bioaccumulation and aquatic toxicity testing:

- the “known constituents approach” (by assessing specific constituents), or
- the “fraction/block approach, (performed on the basis of fractions/blocks of constituents), or
- the “whole substance approach”, or
- various combinations of the approaches described above

Selection of the appropriate approach must take into account the possibility to characterise the Substance (i.e. knowledge of its constituents and/or fractions and any differences in their properties) and the possibility to isolate or synthesize its relevant constituents and/or fractions.

## Appendix G: Procedure

The information requirement for an Extended one-generation reproductive toxicity study (EOGRTS; Annex X, Section 8.7.3.) is not addressed in this decision. This may be addressed in a separate decision once the information from the Sub-chronic toxicity study (90-day) requested in the present decision is provided; due to the fact that the results from the 90-day study is needed for the design of the EOGRTS. Similarly the information requirement for a Screening for reproductive/developmental toxicity (Annex VIII, Section 8.7.1.) is not addressed in this decision; as the EOGRTS will cover the same parameters.

This decision does not prevent ECHA from initiating further compliance checks at a later stage on the registrations present.

ECHA followed the procedure detailed in Articles 50 and 51 of REACH.

The compliance check was initiated on 22 March 2021.

ECHA notified you of the draft decision and invited you to provide comments.

In the comments on the draft decision, you requested an extension of the deadline from 24 to 45 months from the date of adoption of the decision. You considered that the extension of 21 months is needed for the study design and possible development of quantitative analytical test methods for the aquatic based environmental testing as the Substance is difficult to test due to its poor water solubility. Furthermore, you also refer to testing capacities of laboratories as a limiting factor *"Testing capacities of established GLP and non-GLP laboratories are both currently, and expected to continue to be, a limiting factor"* and provided a documentary evidence from a CRO indicating *"The program according to current approximate capacity could be fully completed within 38 - 42months."*

ECHA acknowledges the difficulties in testing due to poor water solubility and in conducting the test, including the the development of analytical methods. The letter from the CRO states that 2 months for contracting phase, 5 to 6 months for pre-study chemistry, 12 months for the 90-d study, 12 months for the PNDD study in rats, and 12 months for the PNDD study in rabbits are needed. ECHA reminds that 90-d study and the first PNDD study can be performed in parallel.

On this basis, ECHA has partially agreed with the request and extended the deadline to 30 months. However, the deadline to provide the sub-chronic 90-d study is 12 months.

In your comments on the draft decision, you do not provide any comments on the information requested. You agree that some additional toxicology testing is needed to satisfy the data requirements for the Substance and agree to generate further data. You also state *"[...] especially regarding higher tier testing, we are concerned about the significant number of animals required for the requested studies and, in consideration of animal welfare, intend to refine the testing strategy by applying a tiered approach."*

While ECHA acknowledges your intention to apply a tiered testing approach, we remind you that the deadline to submit the requested information is legally binding.

ECHA notified the draft decision to the competent authorities of the Member States for proposals for amendment.

As no amendments were proposed, ECHA adopted the decision under Article 51(3) of REACH.
